Contact

“Our latest research indicates that, in almost all COVID-19 scenarios, the vast majority of banks should survive. Further, we expect that most institutions can regain their 2019 ROE within five years, provided they are willing to do the hard work necessary on productivity and capital management”.

Introduction

When will the economy return to its 2019 level and trajectory of growth?

Ten months into the COVID-19 crisis, the world has learned a great deal about the disease and the novel coronavirus that causes it. But the knowledge has come at an extraordinary cost: more than 67 million cases worldwide and 1.5 million lives lost. We have also learned more about [how to control the disease](#).¹ But that knowledge too has been hard-won: tens of millions are out of work, a global recession has descended, and trillions in global GDP have already vanished.

These extraordinary sacrifices may be starting to pay off. Hopes are growing for COVID-19 vaccines. New therapeutics are also showing promising results. Manufacturing and distributing these products worldwide will be a significant challenge, but there is no mistaking the change in sentiment. People are daring to hope for an end to the pandemic.

Almost certainly, however, victory still lies some [nine to twelve months](#) in the future.² Meantime, second and third waves of infection have arrived in the Northern Hemisphere, and as people crowd indoors in the cold weather ahead, the infection rate may get worse. As a result, the potential for near-term economic recovery is uncertain. The question of

the day is, When will the economy return to its 2019 level and trajectory of growth?

This report will provide a range of possible answers for the global banking industry—some of which are perhaps surprisingly hopeful. Unlike many past shocks, COVID-19 is not a banking crisis; it is a crisis of the real economy. Banks will surely be affected as credit losses cascade through the economy and demand drops. But the problems are not self-made. Global banking entered the crisis well capitalized and is far more resilient than it was 12 years ago. Our latest research indicates that, in almost all COVID-19 scenarios, the vast majority of banks should survive. Further, we expect that most institutions can regain their 2019 ROE within five years, provided they are willing to do the hard work necessary on productivity and capital management. The farsighted among them will do even better. Such banks can capitalize on some deep-seated and accelerating trends to rethink their organization, business model, and reason for being and to set themselves up for long-term success.

² Sarun Charumilind, Matt Craven, Jessica Lamb, Adam Sabow, and Matt Wilson, "When will the COVID-19 pandemic end?," November 2020, McKinsey.com.

In the first half of 2020, global loan-loss provisions exceeded those in all of 2019.

A deep freeze and gradual thaw

As days have shortened in the Northern Hemisphere, banks have been preparing. In the first half of 2020, loan-loss provisions exceeded those in all of 2019. Banks have not yet had to take substantial write-offs; their forbearance programs and significant government support have kept households and companies afloat. But few expect this state of suspended animation to last. The stock market appears to reflect this: industry market cap has declined by about 17 percent in the first nine months of the pandemic, even as broader markets have risen.

We anticipate that, in months and years to come, the pandemic will present a two-stage problem for banks. First will come severe credit losses, likely through late 2021; almost all banks and banking systems are expected to survive. Then,

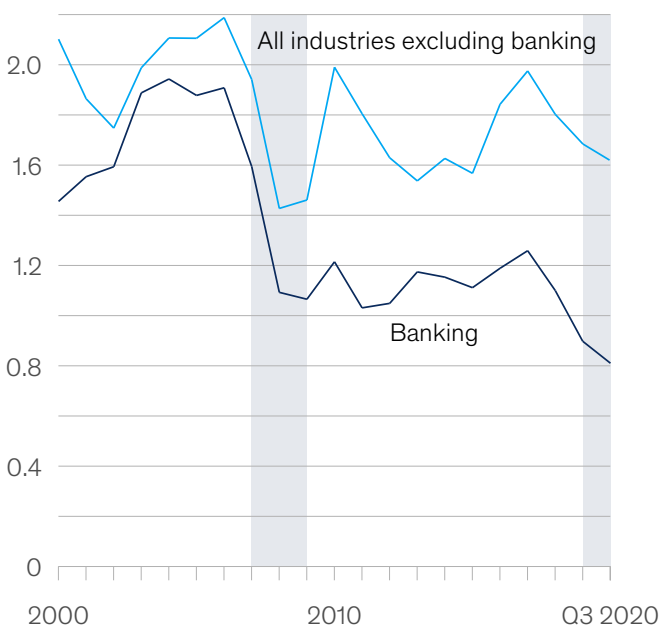

amid a muted global recovery, banks will face a profound challenge to ongoing operations that may persist beyond 2024. Depending on scenario, from \$1.5 trillion to \$4.7 trillion in cumulative revenue could be lost between 2020 and 2024.

In our base-case scenario, \$3.7 trillion of revenue will be forgone—the equivalent of more than a half year of industry revenues that will never come back. In that same scenario, return on equity would continue its decline, from 8.9 percent in 2019 to 5.4 percent in 2020 to 1.5 percent in 2021. At the trough in 2021, ROE would fall to -1.1 percent in North America, -1.8 percent in Europe, and -0.2 percent in developed Asia. ROE would fall from higher starting levels and bottom out higher in emerging Asia (2.5 percent), the Middle East and Africa (MEA; 3.7 percent), and Latin America (5.2 percent); and it would take a smaller dip to 8.6 percent in China.

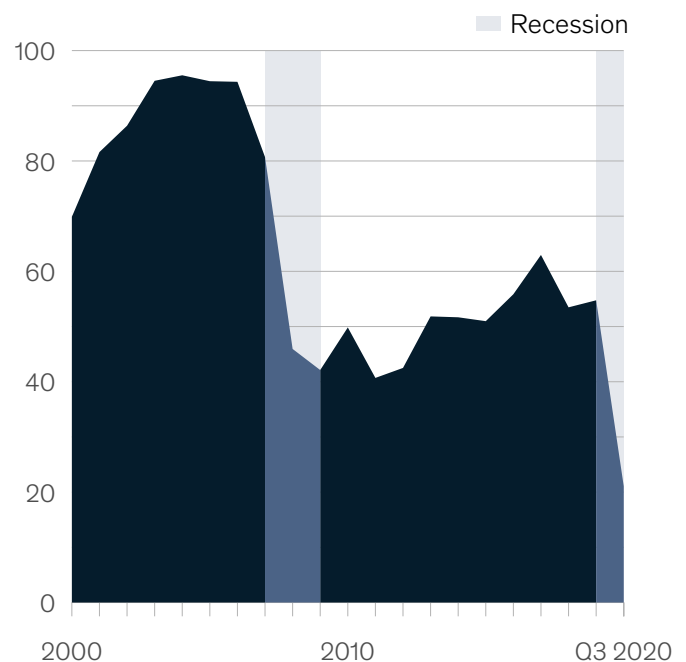

Exhibit 1

The banking industry trades at a 50% discount to the broader economy; more than three-quarters of banks trade below book value.

Price-to-book 2000–20

Banks trading above book value, %

Note: Dataset includes about 1,640 banks and 3,820 companies from other industries.
Source: SNL Financial

\$3.7

trillion of revenue will be forgone, in our base-case scenario

Those effects will be felt keenly by an industry that was already stressed. In last year's edition of this report, we highlighted that nearly 60 percent of banks did not return their cost of capital. By fall 2020, things were worse: the industry was trading at a 50 percent discount to the broader market, a historical low, with 79 percent of banks trading below book value. **(Exhibit 1)**. This is felt differently across regions: North American banks' price-to-book ratio at midyear was more than 30 points higher than that of European banks and 15 points above that of Asian banks. These regional differences reflect changes over the past 20 years. In 2000, the roster of the world's 30 most valuable banks included eight American, 14 European, and just 4 Asian institutions. By November 2020, only 4 European banks remained on the list, which now features 15 Asian and 10 North American banks.

Staying warm

People in northern climates know that winter tests our endurance, skills, and patience. Banks will be similarly stretched. Some will need to rebuild capital to fortify themselves for the next crisis, in a far more challenging environment than the decade just past.

Zero percent interest rates are here to stay and will reduce net interest margins, pushing incumbents to rethink their risk-intermediation-based business models. The trade-off between rebuilding capital and paying dividends will be stark, and deteriorating ratings of borrowers will lead to inflation of risk-weighted assets, which will tighten the squeeze.

As this report lays out in detail, solutions are available to each of these problems. Banks responded extraordinarily well to the first phases of the crisis, keeping workers and customers safe and keeping the financial system operating well. Now they need equal determination to deal with what comes next by preserving capital and rebuilding profits. We see opportunities on both the numerator and denominator of ROE: banks can use new ideas to improve productivity significantly and can simultaneously improve capital accuracy.

Those steps should see them through the immediate challenges but will not set them up for long-term success. To get there, banks need to reset their agenda in ways that few expected nine months ago. We see three imperatives that will position banks well against the trends now taking shape. They must embed newfound speed and agility, identifying

Banks can preserve capital, rebuild their profits, and position themselves for the strategic shifts now underway.

the best parts of their response to the crisis and finding ways to preserve them. They must fundamentally reinvent their business model to sustain a long winter of zero percent interest rates and economic challenges, while also adopting the best new ideas from digital challengers. And they must bring purpose to the fore, especially environmental, social, and governance (ESG) issues, and collaborate with the communities they serve to recast their contract with society.

About this report

This is the tenth edition of McKinsey's Global Banking Annual Review and is based on insights and expertise from McKinsey's Global Banking Practice. It is structured in three chapters. In the first, we review banks' pre-COVID-19 context, examine the effects of the crisis to date, and estimate the effects still to come. In the second, we outline the short-term actions needed to adapt. In the third, we trace the trends accelerated by the pandemic and detail the three imperatives banks will need to pursue if they are to thrive in coming years.

Banks can use new ideas to improve productivity and capital accuracy simultaneously.

“The crisis will play out in two stages. For most banks, the chief concern through 2021 will be credit losses of a magnitude not seen in decades.”

A long winter

The COVID-19 pandemic slammed shut a decade-long window of opportunity for banks. Banks had spent the time building capital reserves—a regulatory requirement whose importance is evident in light of the current crisis. However, most industry incumbents did not use the boom to prepare their businesses fully for what is shaping up as a significant bust. Building capital stocks inevitably lowered ROEs, and in many cases, banks did not adapt their business models enough to generate sustainable positive returns. What's more, few are prepared for zero percent interest rates. Margins and revenues are set to shrink further.

The crisis will play out in two stages. For most banks, the chief concern through 2021 will be credit losses of a magnitude not seen in decades. In 2022–24 and possibly beyond, decreased demand and anemic net interest margins, depressed by a prolonged zero-rate environment, will surpass risk cost as the industry's primary ailments.

In this chapter, we outline scenarios for the pandemic and economy, estimate the effects on ROE, and describe how we expect the next four years will play out for the industry.

Scenarios for the pandemic and the economy

Each month since April 2020, McKinsey has surveyed more than 2,000 global executives across industries on the likely path of the pandemic and the economic recovery.³ We asked them

³ "Nine scenarios for the COVID-19 economy," October 2020, McKinsey.com.

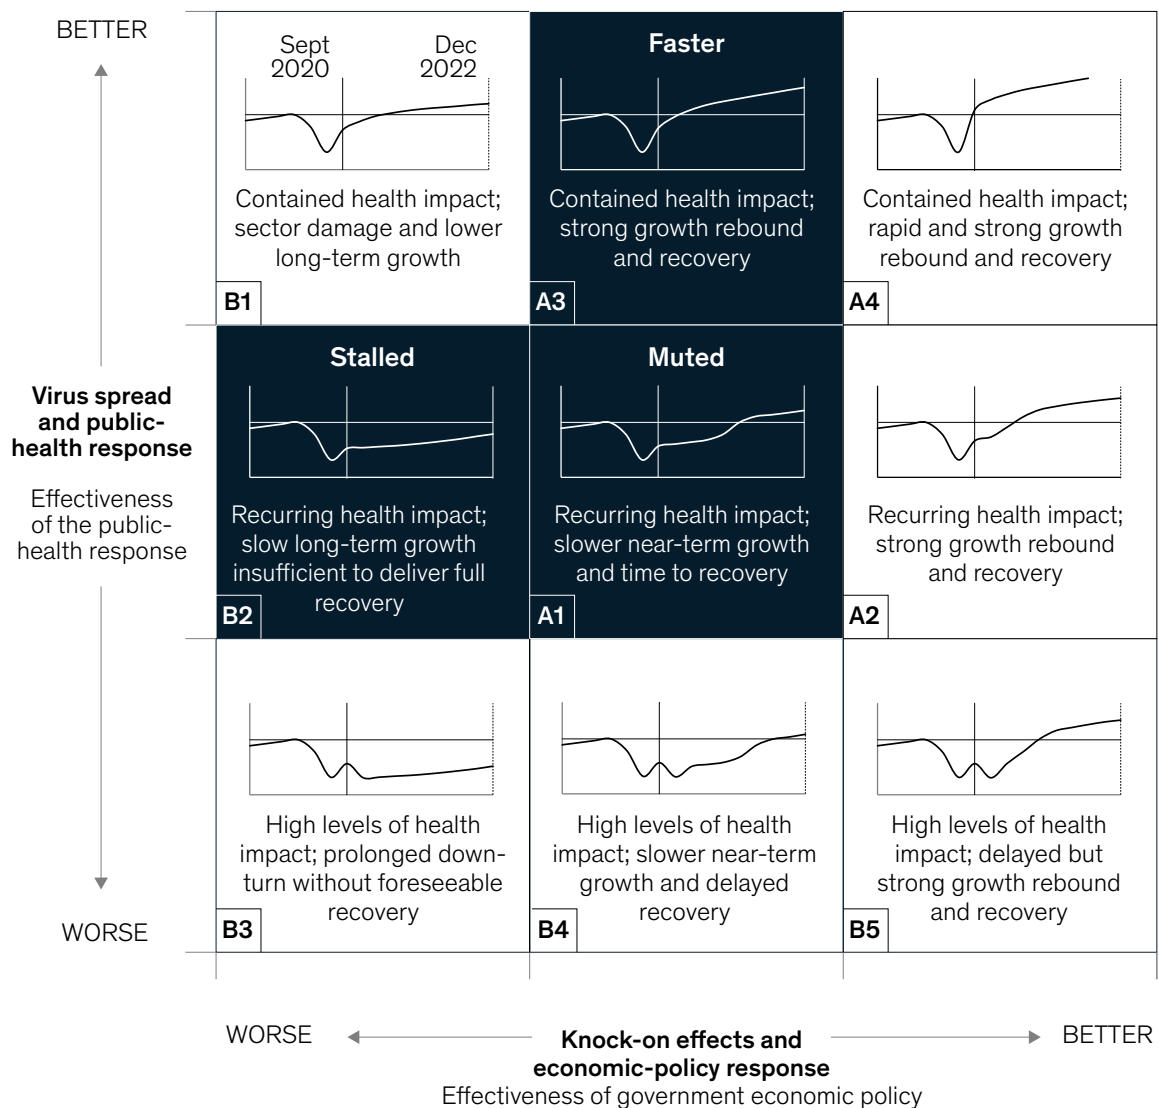

to take a view on two critical dimensions that will shape the evolution of the crisis: the potential for rapid and effective control of the virus and the effectiveness of government policy interventions. The three alternatives along each dimension yield nine scenarios, four of which are more positive (the “A” scenarios), and five more negative (the

“B” scenarios). In the past three months, the outlook has been steady. Business leaders see a diminishing potential for rapid and effective control of the virus, and they are only moderately optimistic about the effectiveness of government policy interventions.

Exhibit 2

Executives continue to favor A1 as the likeliest global COVID-19 scenario; some see A3 and B2 as more likely.

Most likely scenarios for COVID-19’s impact on global GDP

Source: McKinsey analysis, in partnership with Oxford Economics

Most executives anticipate a muted recovery (our scenario A1) (**Exhibit 2**). Many also expect scenario B2, in which recovery stalls; scenario B1, in which economic interventions are ineffective, is also on the minds of executives. A smaller segment anticipates a faster recovery like that shown in scenario A3. On balance, a narrow majority (55 percent of respondents in our October survey) foresee an epidemiological and economic resolution to the pandemic in 2021. Nearly half expect the crisis to resolve in one of the pessimistic B scenarios.

Regionally, respondents in Asia–Pacific, India, Latin America, North America, and developing markets expect that economic conditions in their country will improve in six months. Two exceptions to the trend are Greater China (Mainland China, Hong Kong, and Taiwan), where expectations have been high for months but dipped slightly in October, and Europe, the only region in which respondents on average expect their countries' economic conditions to decline rather than to improve.

In this report, we use the muted recovery (A1) as the base case for our projections and the stalled recovery (B2) as the proxy for the range of more challenging scenarios. We also include a view of the faster-recovery scenario (A3), which might be observed in regions with continued solid public-health responses. While A1 is our global base case, it's of course possible that countries may experience more positive (or negative) scenarios in the coming months and years.

The pandemic's two-stage impact on global banking

The final tally of economic damage from this crisis won't be known for some time. What we do know is that the crisis will take a few years to resolve for banks and is likely to play out in two distinct stages.

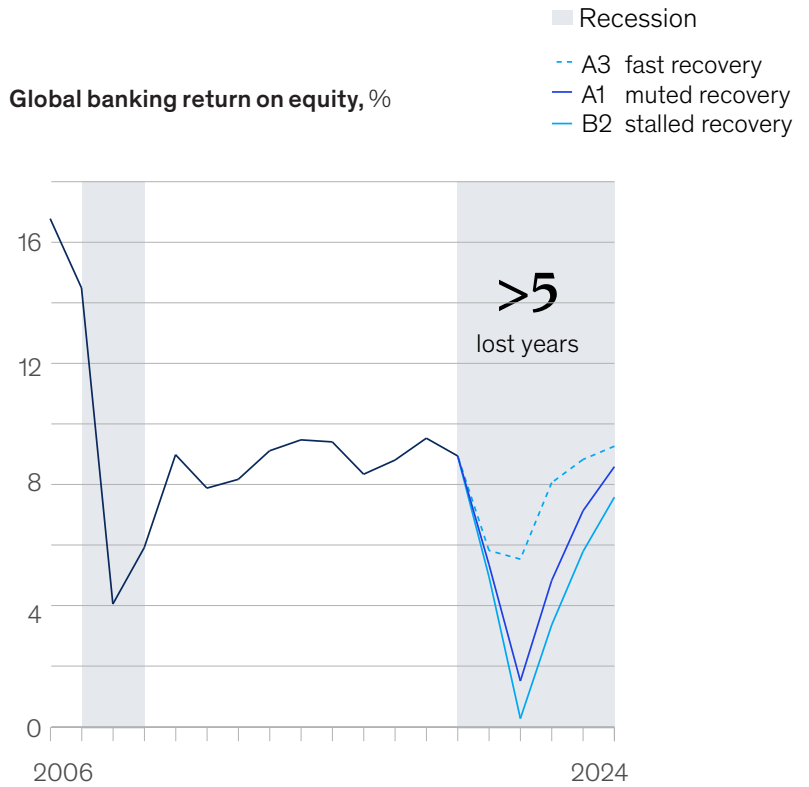

A few challenging years ...

Banks' returns have trended sideways for a long time. By our calculations, 63 percent of banks did not return their cost of capital in 2019. The current crisis has already started to make this situation much worse. In the first half of this year, that number grew to 77 percent. What's more, the average bank's ROE does not cover its cost of equity in 83 percent of countries, up from 71 percent a year ago.

Without management action, in scenario A1, the global average industry ROE could fall to 1.5 percent in 2021 before improving to 8.6 percent by 2024—again, absent management action (**Exhibit 3**). This would still be lower than the 8.9 percent recorded in 2019.

In most scenarios, banks in North America would see a faster decline in ROE and a more robust recovery than banks in Europe (Exhibit 4). Both regions, along with developed Asia, face negative ROEs in 2021 under scenarios A1 or B2. The impact is smaller in China. Banks in Latin America and the Middle East and Africa face steep falls but reasonably steady recoveries. Emerging Asia is the only region where banks can expect ROEs to be higher post-crisis than before, driven largely by Indian banks writing off higher-risk assets quickly and emerging from the crisis sooner, thus reducing their future capital need.

... in two phases

The painful dynamics just described will unfold in two very different phases (Exhibit 5). One of the first effects of the crisis has been an increase in loan-loss provisions. Despite a better-than-expected set of numbers in third quarter 2020, we expect that credit losses will be the main focus for 2021. In subsequent years, the focus will shift toward revenues, which will continue to come under pressure.

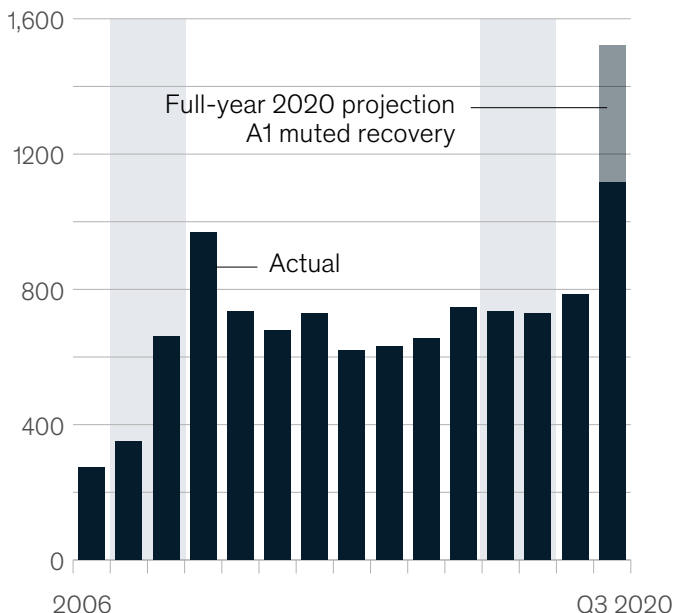

Credit losses and capital cushions: Bend but don't break

As the crisis began in March 2020, most banks joined the initial rush to secure liquidity and funding. They succeeded, and then some: as the year ends, liquidity levels are at record highs for most banks. For the moment, this is not the industry's primary concern, unlike in some previous crises. Instead, the immediate concern for the next year is capital.

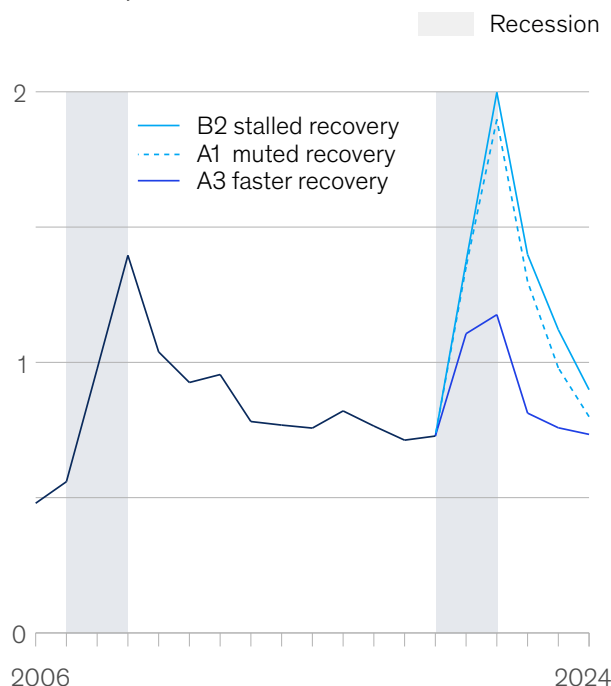

To curb the spread of the virus, societies around the world have attempted the heretofore unimaginable: they have shut their economies, instantly throwing tens of millions out of work and closing millions of businesses. Those people and businesses are banks' customers, and their inability to keep up with their obligations would be expected to sharply increase personal and corporate defaults. In anticipation of this, through the third quarter of 2020, global banks had provisioned nearly \$1.2 trillion for loan losses, much more than they did through all of 2019 (Exhibit 6). North America and Europe drove that trend, provisioning more than their 2015-19 averages. In the United States, new

Globally, loan-loss provisions in the first three quarters of 2020 surpassed those for all of 2019, and by 2021 they could exceed those of the global financial crisis.

Nominal provisions for loan losses, 2000–20E (fixed 2019),
\$ billion

Provisions as a percentage of total loans, by scenario, 2000–24, %

Source: SNL Financial, McKinsey Panorama Global Banking Pools

accounting requirements for current expected credit losses (CECL) have amplified that trend by pulling forward provisions that previously might have been taken in later quarters. China was also on track to provision more for the year than it did in recent years, though not by as much. Overall, through the second quarter, real questions persisted about prospective credit losses and their impact on capital levels.

In third quarter 2020, provisions at many banks fell substantially from earlier quarters. Some of this drop reflects the fact that government support for the economy (including supplemental unemployment insurance, stimulus payments to individuals and affected industries, and sponsored commercial loans) and bank forbearance programs are having the intended impact in many jurisdictions. It may also reflect the influence of International Financial Reporting Standard 9 (IFRS 9), which calls for banks to take provisions much earlier than before. The impact of this new standard may also be felt strongly in 2021, as more loans become problematic. Our conversations with chief risk officers suggest that

as these effects play out, government support expires, and bank programs subside, most banks expect provisions to increase in the next year.

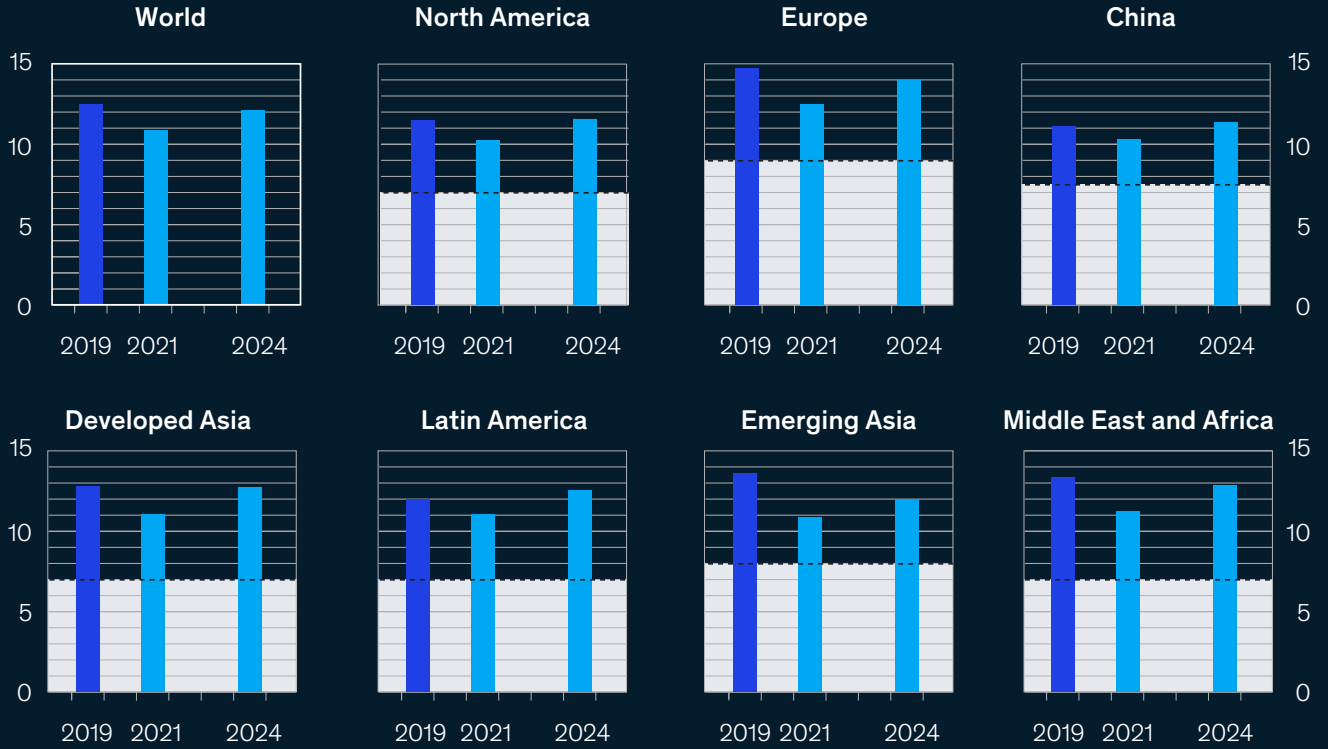

In scenario A1, provisions are likely to rise to levels higher than in the global financial crisis (**Exhibit 6**). In the more pessimistic scenario B2, provisions would rise to 2 percent of total loans in 2021. In contrast, a handful of countries seem to be on a path toward scenario A3, a relatively rapid recovery by 2021; for them, risk costs would likely remain lower than in 2008–09.

Despite the high level of projected provisions, in our central scenario A1, the industry is sufficiently capitalized to withstand the shock (**Exhibit 7**). On average globally, under this scenario, common equity tier 1 (CET1) ratios would decrease from 12.5 percent in 2019 to 12.1 percent in 2024, with a low point of 10.9 percent expected in 2021. Regions would follow slightly different paths, but the overall system should be resilient enough. Even in a stalled recovery (scenario B2), we estimate that CET1 ratios would fall only an additional 35 to 85 basis points, depending on region.

On average, capital cushions appear to be sufficient.

Source: SNL Financial.

Banks and regulators are rightfully curious: How much more pressure can the system take? In other words, what would it take for capital reserves of the average global bank to fall below regulatory minimums? According to a sensitivity analysis of loan-loss provisions in scenario A1, the depth of the crisis would have to be nearly twice as bad as currently projected to see the global average bank's CET1 ratio fall below 8 percent, the approximate regulatory capital requirement in many regions. For example, looking at large developed nations, unemployment would need to more than double in North America and Europe or triple in China, and GDP would have to fall roughly 20 percent during the crisis's worst year in North America or Europe, or nearly 5 percent in China. Economic devastation on that scale would

produce a near-twofold increase in projected provisions for loan losses, to a peak of 3.7 percent of loans globally in 2021, instead of a projected 1.9 percent peak under scenario A1.

The base-case scenario will be troubling for banks that were already unhealthy. Under scenario A1, we estimate that 83 percent of the largest 750 global banks are likely to be safe; the other 17 percent have at least modest risk. Seven percent run at least a moderate risk of CET1 ratios falling below 8 percent (**Exhibit 8**). Three percent of banks, representing about 0.6 percent of banking capital, might suffer capital losses that take their reserves below 4.5 percent, a threshold at which their viability would be jeopardized.

3%

of banks have a >50% chance of falling below regulatory capital minimums

If several banks were to cross that line, especially if a global systemically important bank (GSIB) were among them, the financial system would be on the brink of a different kind of crisis. Notwithstanding the deep liquidity reserves banks have accumulated, the failure of even a relatively small bank could set in motion a broad-based negative spiral. If one or more GSIBs were caught short in such a run, the system could be under pressure, likely from a panic-driven liquidity or funding crisis. Even if liquidity continues to be abundant, sustained confidence in the banking system is critical to its function. Against this backdrop, regulators, governments, and central banks will continue to play a critical role in maintaining confidence in the system, including signaling that they will serve as a backstop, if necessary.

These global estimates are just that, estimates, and are subject to factors that are difficult to model. For one, accounting standards differ across regions. For another, financial models cannot accurately predict the behavior of all major actors (banks, governments, and customers) in this system—behavior that has so far muted the impact of the crisis. Banks' efforts to provide widespread payment deferral and customer assistance may not continue in all cases.

Government support and increased unemployment insurance payments have buoyed several sectors and assisted millions who are out

of work. However, it's not yet clear whether these measures will see countries through to the end of the crisis. As temporary programs evolve or wind down, banks will likely reckon with the fuller force of the crisis. In the United States, unemployment insurance and other assistance programs have ended in some states and been extended in others. A good deal of uncertainty surrounds the future of these programs. Some 10 million Americans are unemployed currently. In our view, given the resulting disruption in cash flow for these households, and Americans' average savings balances, many households are likely to become delinquent within a few months after job loss and the end of government benefits. Bank charge-offs should follow about 3 to 6 months later.

Finally, many retail customers have adapted to the crisis by cutting their spending and reducing debt. But customers' options are limited, and delinquencies may soon rise. Globally, customer sentiment indicates confidence is still low and missed payments are likely to continue.

In the United States at the end of the third quarter, two-thirds of financial decision makers were either pessimistic or unsure about their confidence in the overall economy, believing that the economy would be affected for six to 12 months or longer and would stagnate, slow, or fall into a lengthy recession.⁴

⁴ McKinsey Financial Insights Pulse Survey, N = 2,015, US survey, September 27, 2020. Data were sampled and weighted to match the US general population 18 years and older. The margin of error for wave-over-wave changes is plus or minus three percentage points for all financial decision makers and larger for sub-audiences.

In 2019, retail and corporate banking were by far the biggest contributors to the top line — but are also sensitive to a zero-rate environment.

Revenues: More than \$3 trillion lost

In the second phase, impact will shift from balance sheets to revenues. In some respects, it will only amplify and prolong preexisting trends, such as low interest rates. But it will also reduce demand in some segments and geographies. On the supply side, we expect banks to become more selective in their risk appetite. Of course, there will be offsetting positive effects for the industry, such as a need to refinance existing debt, and some regions and industry segments will still benefit from secular tailwinds. In addition, government support programs are expected to continue to support activity in some places.

However, on balance, the outlook is challenging. Globally, we expect that in scenario A1, revenues could fall by about 14 percent from their precrisis trajectory by 2024 (Exhibit 9). Translating those numbers into absolutes, compared with precrisis growth projections, the industry could face \$1.5 trillion to \$4.7 trillion in aggregate lost revenue between 2020-2024, depending on scenario (\$3.7 trillion in the base-case scenario A1). That represents more than a half year’s revenues for the global banking industry—activity that will never come back.

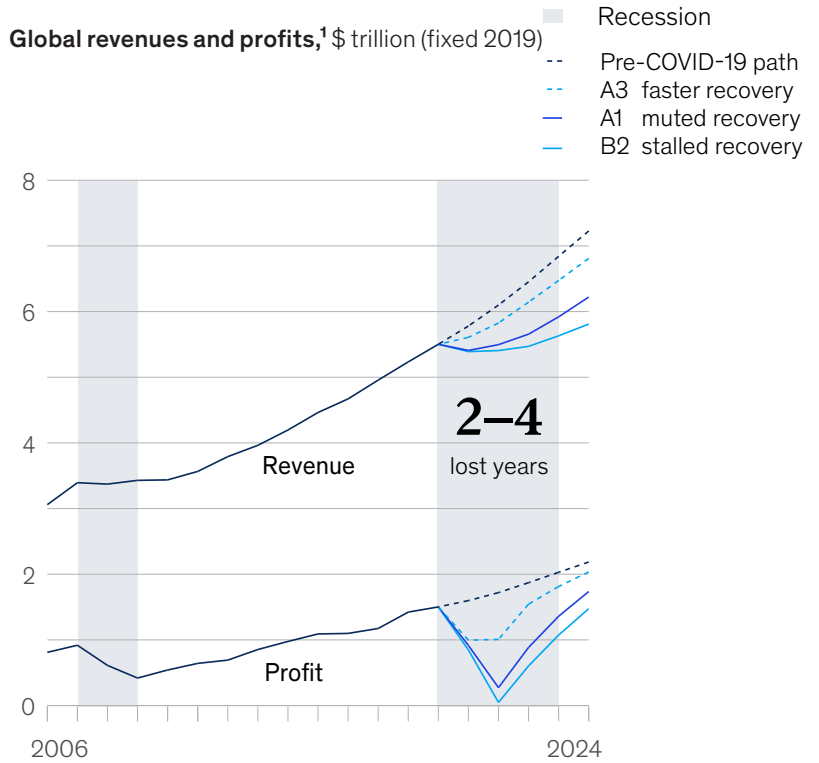

To understand how revenues might change in various banking businesses and the world’s major regions, let’s start with a review of financial-intermediation revenues in 2019, earned by banks and others such as hedge funds (Exhibit 10).

The revenues earned by shadow banking, as many call it, grew twice as fast as banks’ balance-sheet businesses between 2017 and 2019. Looking more closely at revenues by lines of business, we see that in 2019, by far the biggest contributors to the sector’s top line were retail and corporate banking, which are also sensitive to a zero-rate environment and increased risk. Fee-based businesses—wealth and asset management, market infrastructure, investment banking, and payments—are a smaller portion of the banking revenue pool. But institutions that have meaningful businesses in these sectors have found themselves more resilient to the crisis so far.

Exhibit 11 lays out our projections for revenue growth from 2019 to 2024 across key regions and business lines in the base-case scenario. (These projections are for banks only.) Retail and commercial banking, which together represented two-thirds of total global industry revenues in 2019, are likely to grow at about the same rate as regional GDP. Payments looks set for the strongest growth, particularly in North America. Looking at each business line, we can find additional insights:

Exhibit 9

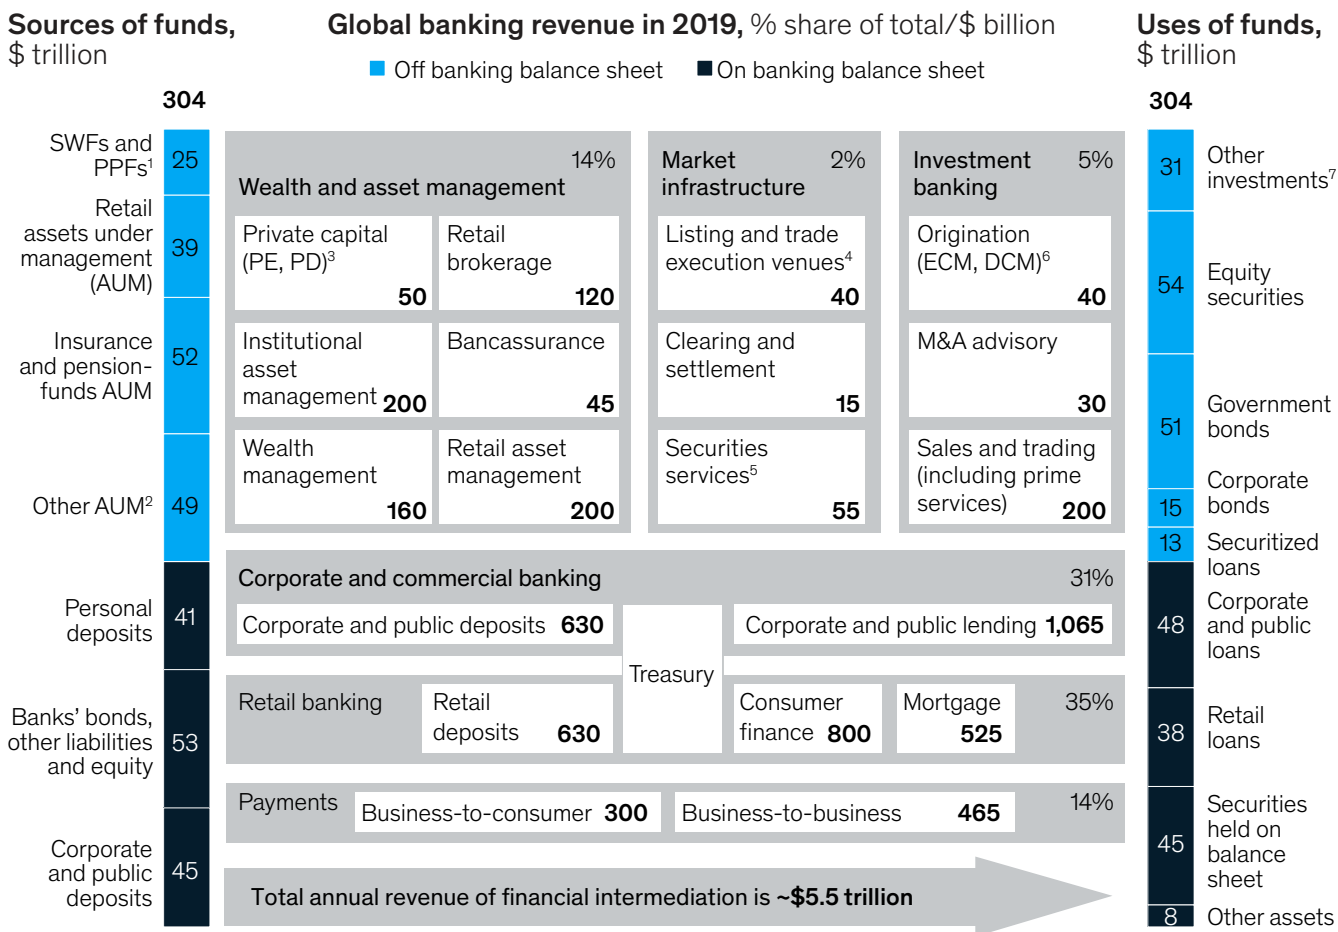

Banks’ resilience will be tested; revenues may not recover for two to four years.

¹Profit forecasts assume continuation of cost-reduction trends from previous 5 years. Note: Chart shows year-end data. Source: McKinsey Panorama Global Banking Pools

- **Retail:** Deposit revenue for retail has seen a short-term increase, given a surge in volumes in the past year. Looking ahead, it is expected to decline then stagnate as interest rates remain low or fall further, though fee income from deposit accounts is expected to remain. Consumer financing originations are expected to fall with consumption, offset by potentially higher rates to compensate for higher risk. Mortgage rates are likely to continue to be low, which will drive high volumes of refinancing and purchases.

Global financial intermediation is a complex system that generated about \$5.5 trillion in annual revenue in 2019.

¹Sovereign-wealth funds and public-pension funds. ²Endowments and foundations, corporate investments. ³Private equity, private debt. ⁴Includes exchanges, inter-dealer brokers, and alternative venues but excludes dark pools. ⁵Custody, fund administration, corporate trust, security lending, net interest income, collateral management, and ancillary services provided by custodians. ⁶Equity capital markets, debt capital markets. ⁷Real estate, commodities, private capital investments, derivatives.

Source: SWF Institute; McKinsey Capital Markets and Investment Banking Pools; McKinsey Global Institute McKinsey Panorama Global Banking Pools; McKinsey Performance Lens Global Growth Cube

- **Corporate and commercial:** At the outset of the crisis, the corporate and commercial line saw large inflows as corporates began drawing down lines of credit to sustain themselves through shutdowns. Government loan programs also pushed balances up considerably. Looking ahead, supply may be more limited because of credit risk, and repricing to low rates may shrink margins.
- **Payments** revenues will see growth driven by recovering consumer spend and by shifts in payments methods in several regions. In emerging markets, consumers will likely

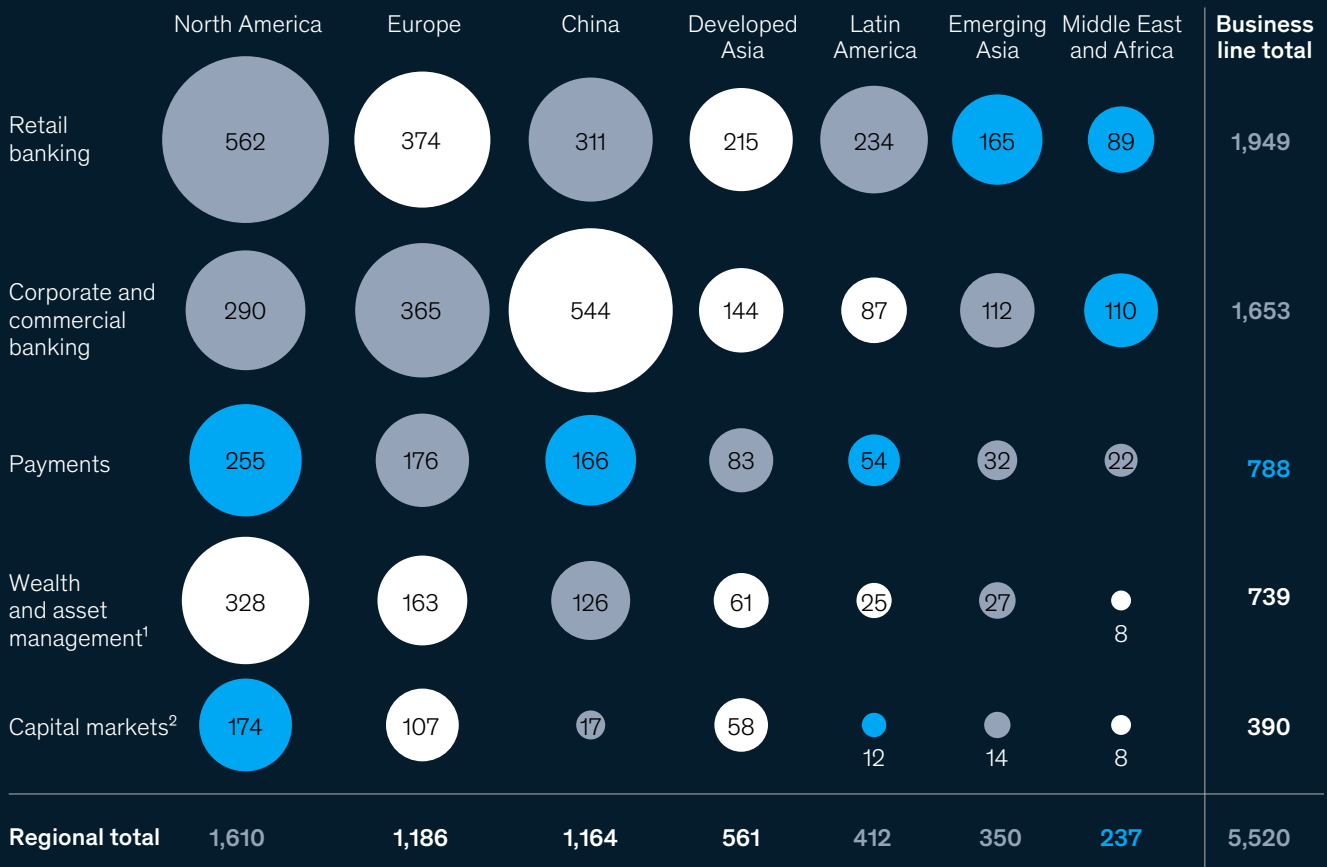

continue to shift from cash to both traditional and alternative electronic payments. In developed markets, a shift from credit card to POS credit and other alternative methods is taking off; both are seeing historical growth rates. Payments to vendors and from customers are also digitizing quickly for both large corporates and small businesses. However, given slowing travel patterns, payments networks and others could feel the impact of reduced physical cross-border spend, which is typically a major profitability driver.

Growth in the industry's largest segments will likely lag GDP growth globally and in most regions.

Global industry revenues, by business line and region, 2019, circle size = \$ billion

Global industry growth relative to GDP, 2019–24

● CAGR above GDP ● CAGR at GDP ● CAGR below GDP

¹Doesn't include private capital revenues.

²Includes revenues from investment banking and market infrastructure.

Note: Figures may not sum because of rounding.

Source: McKinsey Capital Markets and Investment Banking Pools; McKinsey CIB Insights; McKinsey Panorama Global Banking Pools; McKinsey Performance Lens Global Growth Cube

Banking will grow faster than GDP only in certain businesses and geographies:

- Retail banking in emerging Asia and MEA
- Corporate banking in MEA
- Payments in North America, China, and Latin America
- Capital markets in North America and Latin America

Leading banks, fintechs, and platform companies have continued to invest during the crisis, particularly in digital channels.

- **Wealth management** revenue growth over the next four years will be mostly driven by market performance, though to be sure that is highly uncertain especially under a muted recovery scenario. The emergence of low-cost models (such as remote advisory) is also likely to put pressure on pricing and fees for traditional service models, which may limit growth. However, wealth management will continue to be an attractive business due to its capital efficiency and growth profile relative to other opportunities, and its increasingly central role in financial advisory as other advisory services such as insurance consolidate. Low interest rates will continue to drive asset owners to look for new sources of yield, and increasing digital adoption is bound to make services more accessible and relevant than ever for mass and mass-affluent clients in many regions.
- **Capital markets, investment banking, and market infrastructure:** The flurry of early-2020 volatility and refinancing that buoyed markets-based businesses at some banks will probably not continue at the same pace. Sales and trading businesses are likely to stabilize at a lower level in the coming years. Origination will lag, with fewer companies issuing debt and equity. Increased M&A activity is likely as the crisis continues, although with valuations low in some sectors and at historical highs

in others, there may be fewer motivated buyers and sellers. Market infrastructure—the plumbing of capital markets—is expected to grow as markets overall remain liquid.

It is worth noting that these expectations reflect the average incumbent bank; several banks will outperform. So far through the crisis, some financial-services companies, including large banks, fintech companies, and technology-platform-based financial-services firms have reacted nimbly. They have continued to invest, particularly in digital channels, and remained customer-centric to grow profitably despite difficult conditions.

■ ■ ■

These projections take into account only the impact of the crisis on revenues and the balance sheet. They don't account for mitigating actions that most banks' managements are already taking, especially on cost. Based on what we are able to project, our conclusion is that, in our base-case scenario, the main issue facing the industry will be profitability, not capital-structure resilience.

As we describe next, while the situation will likely become difficult, banks have a full menu of moves that can allay their predicaments and see them safely through the difficult period ahead.

“Those focused on growth should deploy a full range of interventions, including productivity improvements, stronger risk management, and better stewardship of equity capital.”

Strengthening the foundation

In our base case, most institutions should be able to withstand the recession now gaining force. But no one should confuse survival with success. With capital and revenue greatly diminished, banks could face the risk of a kind of twilight existence. Rebuilding their economics will be a severe test, but the tools are available to make it happen. Those focused on growth should deploy a full range of interventions, including productivity improvements, stronger risk management, and better stewardship of equity capital.

Estimating the work ahead

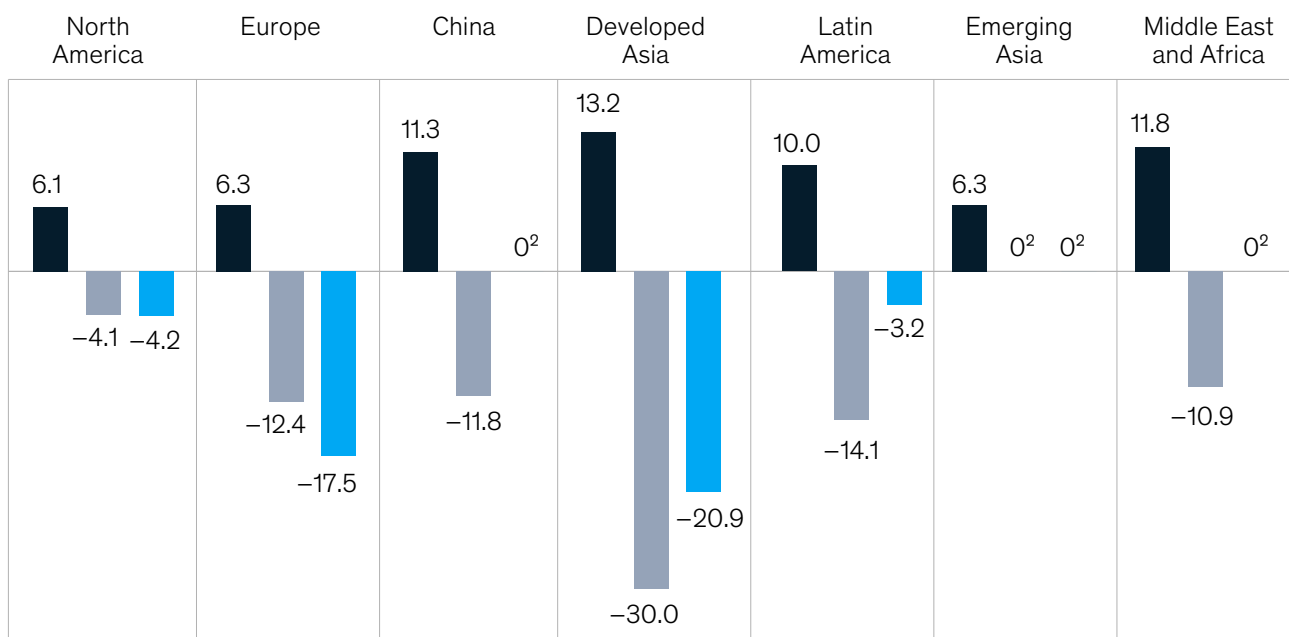

Banks that reacted to the 2008 crisis quickly and decisively fared much better in the long term than those that did too little or moved too slowly. By and large, many US banks moved quickly and decisively, and many European banks did not. This at least partially explains the difference in performance between the two regions in the past decade.

Thus, a key lesson from that crisis is that banks must move quickly. But where should they direct their energies? And what will it take? **Exhibit 12** lays out a sensitivity analysis of the three levers banks can pull: increasing revenues, managing costs, and better managing their equity capital. Getting back to precrisis ROE will require significant but attainable effort.

Banks can pull three levers to rebuild their economics.

Annual change in individual lever required, holding others consistent with A1 scenario projections, to reach pre-crisis return on equity by 2024, % compared to 2021 trough

● Revenue ● Cost ● Equity

Pre-crisis ROE, ¹%

11.2	6.3	11.4	6.1	15.9	7.3	11.9
North America	Europe ¹	China	Developed Asia ¹	Latin America	Emerging Asia ¹	Middle East and Africa

¹In 3 regions, pre-crisis ROEs were below 10%: Europe (6.3%), Developed Asia (6.1%), and Emerging Asia (7.3%). In these regions, we have calculated the change required in revenues, costs, and equity to lift ROEs to 10%.

²Given projected revenue growth in this region, the average bank could in fact increase costs or equity and still return to target ROE.

Source: McKinsey analysis

The level of emphasis on each of these levers will vary by region. Near-term recovery will require even more work in regions such as Europe, which already had fundamental challenges to profitability, depressed margins, and ROEs far below the cost of equity. Banks in developed Asia have already cut costs substantially. For them, the 30 percent cost cut shown in Exhibit 12 may not be realistic; revenue and capital levers are more attractive.⁵ European banks have faced a low- or zero-rate environment for years and have made the easiest adjustments. These banks have a steep, slow path to economic recovery and will need the full arsenal of cost and revenue optimizations. The wave of consolidation

taking shape in that region indicates that some institutions may not be up to the task.

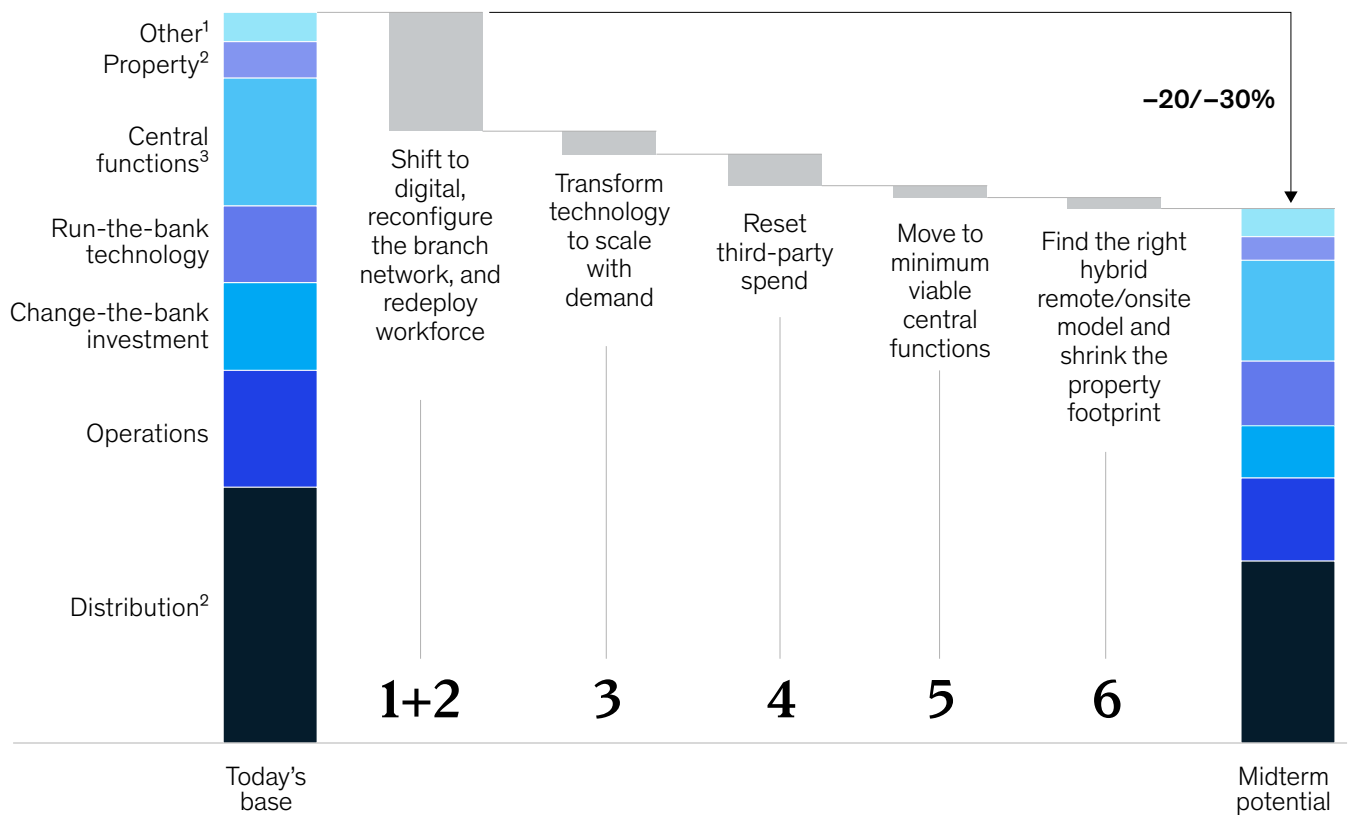

In Canada and the United States, although the challenge is not as great, regulatory changes and digitization are front-and-center issues; to address them, banks will likely draw on a combination of cost-productivity initiatives and innovative revenue models. Emerging Asian banks face less challenging rate environments and are more focused on disintermediation by technology players. In emerging economies, one of the most formidable challenges will be credit losses.

Expanding revenues in a world of zero percent interest rates and technology disintermediation

⁵ In many Asian countries, costs are already considerably lower than in other parts of the world.

A six-part program can boost productivity by up to 30 percent.

³Includes HR, finance, risk, compliance, etc.

Source: McKinsey analysis

is a broad, strategic, potentially long-term task; we discuss it in Chapter 3. To address costs and capital, banks have at their disposal several tested levers, which can yield significant near-term impact. Approaching these costs in new ways, banks can ensure this impact is not simply “one and done” but continues beyond the crisis. In the short term, we believe every bank should focus on creating what we refer to as a productivity engine, rebuild its risk-management muscle, and improve its capital management.

Build a productivity engine

In recent years, the global industry has made some headway at reducing expenses. The industry’s cost-to-income ratio fell from 56.6 percent in 2014 to 54.4 percent in 2019. Every region has made

progress. But bank leaders know that more could have been done. Some factor costs have fallen much faster than banks’ overall costs: for example, the cost of computing power has decreased by 57 percent since 2014, and the cost of data storage is down 72 percent.

Banks have worked hard at automation to take advantage of these trends but have added complexity in parallel, with the result that the bulk of the cost savings has been eaten away by new functions. They have also, of necessity, added new compliance layers that have increased costs. In the end, cost ratios have fallen but not as much as in less regulated industries that have been completely reshaped by technology and changing customer needs.

In our view, a big part of the problem is that banks conceive of cost savings as one-and-done programs. Instead, they should imagine an ongoing “engine”—a capability and mindset dedicated to continuous improvement—that will see them through the coming years with both greater productivity and better customer experience. The “cylinders” of that engine might be the six parts of the program illustrated in **Exhibit 13**. We estimate that, at full throttle, such a productivity program can improve efficiency by roughly 20 to 30 percent.

1. Accelerate the shift to digital and reconfigure the branch network

Banks are slowly reopening their branches in markets where the pandemic has eased. Demand has softened in the interim. Over the past year, the use of cash and checks—core transactions for branches—has eased; in most markets, about 20 to 40 percent of consumers report using significantly less cash. In the meantime, customer interest in digital banking has jumped in many markets, although this trend varies widely. In the United States and the United Kingdom, only 10 to 15 percent of consumers are more interested in digital banking than they were before the crisis (and 5 to 10 percent are less interested). In Greece, Indonesia, Mexico, and Singapore, the “more interested” share ranges from 30 to 40 percent.⁶ Factors affecting growth in digital banking include the existing digital offerings and capabilities of banks in the market and precrisis levels of digitization.

Trends are going against the branch. But capturing productivity gains is not a matter of bluntly reducing the branch network. Branches still serve a purpose, but customer needs are evolving.⁷ In countries where preferences are moving more slowly, banks have an opportunity to shape them. As they reopen their branch network, banks can consider three actions.

Make the new digital behaviors stick. First, consider how to reinforce the new digital behaviors through consumer education about the bank’s attractive value proposition, combined with nudging to make the behaviors easier. Even before the crisis, leading banks in developed markets had achieved 25 percent less branch use per customer than their peers by migrating payments, transfers,

and cash transactions to self-service and digital channels. In addition to those who were already digital-only customers previously, another 10 to 15 percent of customers will be unlikely to use a branch after the crisis, further increasing the need to act.⁸

Redesign the bank’s footprint. Banks can also redesign their footprint based on new customer behaviors. Branch networks have expanded and shrunk over the years, but COVID-19 demands that banks move beyond the heuristics that have prompted shifts in recent years. Leading banks are using machine learning to study every node of the network, with particular attention to demographics, ATM proximity, and nearby competitors. One bank developed an algorithm that considered the ways branch customers accessed seven core products. It found that 15 percent of branches could be closed while still maintaining a high bar on serving all customers, retaining 97 percent of network revenue, and raising annual profits \$150 million. A/B tests in comparable micromarkets also can help banks make these choices.

Transform contact centers. Banks should also make complementary moves beyond the branch network. During the crisis, contact centers have seen dramatically increased volumes, greater than the increases in digital banking. To respond to these new needs, banks can transform contact centers to further automate simple services, focusing human agents on complex needs. Leading banks are increasing containment rates for interactive voice response (IVR) and chatbots, introducing click-to-call functionality to avoid manual identification and verification steps, and using artificial intelligence (AI) for live coaching of agents and to check script compliance.

2. Systematically redeploy the workforce and reskill at scale

In the short term, COVID-19 has changed the workload for specific job families, especially in operational roles, creating much greater demand for a higher-skilled workforce (for example, contact-center agents), and lowering demand for branch bankers and similar process-heavy roles. Chief human resource officers can manage this shift by setting up a reskilling hub that works

⁶ Nikki Chemel, John Euart, Jonathan Gordon, Ajay Gupta, Atakan Hilal, Joshua Hsu, and Olivia White, “Financial decision-maker sentiment during the COVID-19 pandemic: A global perspective,” 2020, McKinsey.com.

⁷ Eleanor Bensley, Sergey Khon, David Tan, and Zubin Taraporevala, “Breaking away from the pack in the next normal of retail banking distribution,” July 2020, McKinsey.com; and Ashwin Adarkar, Aditya Dhar, Saptarshi Ganguly, Marukel Nunez Maxwell, and Mateen Poonawala, “Transforming the US consumer bank for the next normal,” September 2020, McKinsey.com.

⁸ Chemel et al., “Financial decision-maker sentiment during the COVID-19 pandemic: A global perspective,” 2020.

across business units to act as a single point of talent assessment, retraining, and redeployment. The hub forecasts supply and demand for job families, rebalancing the mismatches banks are now experiencing, and then acts as an academy to reskill and redeploy staff into high-demand areas. This is particularly apt for the big portion (50 to 60 percent) of the talent pool whose work follows standardized, rules-based processes.

Branch banking is a critical focus. Staffing in the retail branch was already a challenge. Now banks need to conceive flexible roles that mix on-site and remote work, such as the customer experience officer. Rules-based workers can be redeployed in different roles, based on assessed skill adjacencies. Branch bankers can perform their traditional teller tasks with some portion of their time. With the remainder, they can get trained on new skills to become contact-center agents. Over time, some people can acquire a full set of skills and become “universal” bankers, able to work well in a variety of roles. Another example addresses the heavy workload of drive-through tellers and

to market by over 50 percent and improving customer and employee satisfaction significantly. The levers are mostly well known, but the extent to which they are being applied is unprecedented.

First, banking IT functions are implementing best-in-class engineering practices. The core of these practices is a multidisciplinary operating model with joint business and IT teams, joint accountability for product delivery, and modern agile ways of working. High levels of automation help developers move faster; the right model for locating engineering talent helps banks land the skills and expertise they need; and a supply-based funding and planning process ensures that engineering teams are focused on and sufficiently resourced to deliver on top priorities, rather than fragmented across less valuable ideas.

Leading banks are also modernizing their core banking systems by shifting to a platform-oriented architecture, aiming to reuse common code by building platforms that work across borders and across products. As they do this, they are being

Many top banks are starting on the journey toward automated infrastructure and public cloud

small-business bankers: some banks are cross-training branch managers, who are less utilized, on the skills they need to advise and serve small businesses, thus boosting the capacity to meet changing demand.

3. Transform technology to scale with demand

Historically, banks' chief information officers have kept IT costs flat by achieving modest savings that offset increasing demand.⁹ Still, today, less than 10 percent of technology spend at an average bank increases value-added business functionality. Now, even as some forms of technology demand soar, CIOs will face similarly ballooning costs and decreasing responsiveness, unless they drastically reform the traditional banking IT function. This calls for a radical technology-productivity effort. Leading banks have already shown that this can improve IT productivity by more than 25 percent while also shortening time

mindful about creating real-time data flow across platforms and core banking systems, to speed up critical analytics. They are also devising a strategy to exit or manage legacy core banking systems.

Finally, many top banks are also starting on the journey toward automated infrastructure and public cloud. Some are choosing to shift first to a “cloud-like” operating model even for on-premises infrastructure, provisioning their own automated infrastructure and enabling self-service. But many are also considering or shifting to public cloud at scale for major parts of the technology stack, such as digital channels and customer data and analytics, and sometimes using cloud-native applications to let internal customers access the full breadth of services offered.

Although several are already on the technology-transformation journey, many banks have barely left the starting line. In leading banks, as many as

⁹ Kumar Kanagasabai, Irina Shigina, Tomas Thiré, and Phil Tuddenham, “Transforming banks' IT productivity,” November 2019, McKinsey.com.

80 percent of IT employees write code, compared with 25 to 50 percent at a traditional bank. Similarly, in leading banks, more than 30 percent of applications are consumable as platforms—for example, they have a clear set of reusable APIs—compared with almost none in traditional banks. And leading banks are able to automate 85 percent of infrastructure provisioning, compared with 5 to 10 percent in a traditional bank.

CIOs should sequence their institution's technology transformation to balance the structural initiatives that take time, like those just described, with rapid-payback actions such as conducting an end-to-end review of IT spend and contracts to identify optimization opportunities. Banks that move quickly and decisively are more

maintenance costs are abnormally high. They can also help identify rogue procurement transactions across different parts of the organization, identifying opportunities to consolidate vendors and costs.

5. Move to minimum viable central functions

Many banks had already started to simplify their support functions (HR, risk, finance, legal, marketing) prior to the crisis. As they consider moving ahead on further cuts, they can reimagine these functions by first designing a no-frills version that fulfills the most basic services and then carefully adding choices to improve service, speed, and quality. The additional functionality can take advantage of automation, digital servicing, and standardization. This approach delivers two

Many banks see opportunity in permanently adding flexibility to the way people work.

likely than others to emerge with a technology function that is more productive, faster, more responsive, and more resilient.

4. Reset third-party spend through demand re-specification and supplier management

In the crisis, some expense lines have soared, and others have plunged, presenting opportunities to reset the bank's external spending. Where demand has increased and spurred the onboarding of a flurry of new suppliers (such as telecoms and remote-working tools), banks can establish tiering and rationing policies to ensure the extra spend is justifiable and to seek volume discounts. Where demand has fallen dramatically, as for travel and events, banks can adapt policies to reflect these changing needs.

Leading banks are industrializing this approach by setting up spend control towers to manage demand, "negotiation factory" teams to manage suppliers, and cleansheeting to understand supplier margins. When third-party spending is distributed across the bank, new analytics-based tools can ingest transaction data from banks' systems and calculate enterprise-wide spending levels that can be benchmarked against peers to suggest the best opportunities. Such analyses often spot contractors whose day rates are out of line with the norm and branches where

productivity opportunities: stopping unaffordable services and finding new ways to deliver better-quality support at lower costs.

In HR and finance, many banks are already on a path to achieving up to 30 percent productivity gains through standardizing and centralizing, reducing demand, moving to standard software-as-a-service, and digitizing common requests and reports.

By contrast, control functions like risk and compliance have grown in line with the volume of regulation. Banks that are willing to take a fresh look at these functions find substantial opportunities. For example in anti-money-laundering (AML) processes, the best banks are achieving 15 to 25 percent productivity gains and more effective risk management by creating a simpler, more automated process for low-risk customers, allowing know-your-customer (KYC) information and protocols to be shared across geographic borders, and removing duplication between first- and second-line teams.

6. Find the right hybrid remote/onsite model and shrink the property footprint

With new remote-working models in place, many banks see opportunity in permanently adding flexibility to the way people work. In a recent survey of executives who manage real estate

30%

productivity gains in HR and finance through standardizing and centralizing, reducing demand, moving to standard software-as-a-service, and digitizing common requests and reports.

for their companies,¹⁰ about 50 percent of respondents expected at least 25 percent of their workforce to stay permanently remote.

In the short term, the ratio of full-time equivalents (FTEs) per desk will likely fall, as banks seek to maintain social distancing in compliance with local guidelines. When social-distancing measures are eased, retaining a level of remote working could increase a bank's desk ratio from 1.2 FTEs per desk today to 1.6 or 1.8, freeing up 25 to 40 percent of office capacity and enabling a more flexible lifestyle for a meaningful portion of the employee base that wishes to work from home at least part-time.

Strengthen the risk-management muscle

As credit losses mount, risk teams need to tackle two key challenges: improving customer-assistance effectiveness, especially in serving retail customers and small and medium-size enterprises (SMEs), and addressing portfolio and modeling problems such as sectoral concentration, especially in wholesale.

Customer assistance and mitigating losses

As households fall into delinquency, customer-assistance teams will have more work to do, and they will need to do it delicately and well. In our view, the task has three components.

Reassess portfolio risk of delinquency.

Customer-assistance teams will need to reassess

the portfolio risk of delinquency by adapting and updating segmentation models to take into account COVID-19 effects—the new variable that should dictate how banks proceed. Customers and areas that have been affected similarly by the pandemic should be identified through new high-frequency data (including public-health data, information on government actions, sector-specific factors such as mobility data, and so on).

Build digital-first customer assistance. Banks then need to double down on their investment in self-service channels—two-way texting, email, mobile—which will allow for greater self-cure for a big portion of customers and will save costs. Leading banks are pioneering an empathetic, frictionless digital service to help customers find the right forbearance program.

Reskill frontline teams. Digital channels can only do so much; banks need to deploy the necessary capacity in key parts of the credit management cycle. As nonperforming loans rise, banks will need more frontline agents skilled in customer assistance. This will require reskilling the bank's existing frontline teams.

Portfolio review: Sector concentrations

One key factor affecting ROEs in coming years will be the shape of the lending book. On the wholesale side, exposure to hard-hit sectors in commercial and industrial (C&I) and commercial real estate (CRE) lending poses particular challenges. Those more exposed to higher-risk sectors, such as transportation, energy, and

¹⁰ "2020 global occupier sentiment survey: Fall update," CBRE, September 2020, cbre.com.

Banks must also go beyond analyses of sectors and assess individual borrowers.

leisure, face a colder winter than those in the lower-risk sectors (healthcare, utilities, and tech). Banks with significant share in smaller markets could be heavily exposed to a single industry, putting their books at higher risk. Furthermore, risk models are unlikely to be tuned to the differentiated impact the pandemic has had on various sectors, so banks may not detect impact on their portfolios in a timely and accurate manner. Risk teams can address this by reviewing critical models and adding overlays where needed to account for idiosyncratic sector risk and using new, real-time, sector-specific data sets.

Banks must also go beyond analyses of sectors or subsectors and assess individual borrowers.¹¹ They can mitigate some sector risk through careful underwriting, selecting the best credit risks even within at-risk industries, and hedging appropriately. Business models can be very different from one company to another within the same subsector; some will be better suited to survival and a faster recovery in the current environment. Some businesses have a strong online presence, for example, and others do not. One UK bank quantitatively analyzed the probability of default (PD) for companies in each sector. It stress-tested counterparties' ability to pay by assessing the expected shock and recovery trajectories for each sector. The bank found that in the pandemic, PD can vary three or four times in magnitude within a given sector.

Manage capital more accurately

Capital management is a challenging discipline: it requires processing millions of data points through a five-part process (business origination, model development, calculation, regulatory response, and capital planning and allocation). Across all of these domains, banks must heed thousands of rules, exceptions, and alternatives. Managing such complexity often means using proxies, finding metrics that better fit with the business context, and giving up on some level of detail in light of time constraints. These small decisions add up and can often put banks in a safe but too conservative capital stance.

Reviewing all the data points, rules, exceptions, and alternatives to calculate the bank's capital requirements to the last euro or dollar would require considerable time and patience. Our research shows, however, that a subset of these decisions—about 300—can significantly improve the accuracy of capital-requirements calculation; in our experience, the work can save about 2 to 7 percent of risk-weighted assets. These choices offer the most potential with respect to capital accuracy, probability of occurrence, and feasibility of implementation.

¹¹ Efstathia Koulouridi, Sameer Kumar, Luis Nario, Theo Papanides, and Marco Vettori, "Managing and monitoring credit risk after the COVID-19 pandemic," July 2020, McKinsey.com.

In our view, these three steps—productivity improvements, a tuned-up risk muscle, and more accurate capital management—will be important to restoring many banks to their precrisis ROEs in the base-case scenario. For some banks, these measures may not be enough; mergers might be the best way out. Some banks are already pursuing M&A before things get worse. Furthermore, in adverse scenarios, which remain a distinct possibility, almost all banks will need to pursue these same moves more aggressively.

Even as banks work through these short- and midterm considerations, they must also think through the long-term prospects of their core business. For that, most will want to consider the three strategic imperatives we discuss next.

“Banks must recognize the impact of six trends on their customers and businesses, and be prepared to take three actions to mitigate the downsides and make the most of the upsides.”

How banks can thrive

Our first two chapters focused on the impact of COVID-19 on the global banking industry and how the industry needs to react to survive the crisis. But banks' operating environment was already changing fast. The pandemic has accelerated six structural trends that will reset operating conditions. Banks must recognize the impact on their customers and businesses, and be prepared to take three actions to mitigate the trends' downsides and make the most of their upsides. Those that do will not only survive but arrive in style ahead of their rivals.

Six pandemic-accelerated trends

The COVID-19 crisis has accelerated six trends that were already changing the world (**Exhibit 14**). These trends (and their knock-on effects) are affecting every kind of business, including financial institutions.

Six trends have upended the banking industry and yesterday's strategies for success.

Trends

Accelerating deglobalization and geopolitical concerns

Deglobalization was already occurring before COVID-19 but is now accelerating, with gaps in global supply and distribution systems.

Radical changes in the macro environment

COVID-19 is a real-economy crisis, with manifold effects. For banks, these include a prolongation of low interest rates, which will accelerate margin compression, and the extent and duration of central-bank support.

Upheaval in the ways we work

The crisis has upended traditional ways of working, some of which were already beginning to evolve: working from home, dependence on digital tools, distributed teams, changes in workflow and behavior.

Growing challenges from tech players and embedded finance

Digital natives' ability to embed financial services in their platforms has accelerated the drift of customers from their banks. When banks no longer know their customer better than others, they can lose volumes and their feel for customer needs.

Transformed customer expectations

Customers expect a better, more predictive, and seamless experience than ever before—and better advice—across every channel.

Increasing urgency of social and environmental sustainability

Interdependence of nations is now more apparent. Climate and sustainability, responsible capitalism, and economic inequality are playing a larger role in conversations among nations and companies.

Banks must account for each of these:

1. Accelerating deglobalization and geopolitical concerns. As a new multipolar world takes shape, we are seeing more trade disputes and broader geopolitical uncertainty. Already-tense relations between some large countries have grown more precarious. McKinsey Global Institute recently estimated that as a result, 16 to 26 percent of exports, worth \$2.9 trillion to \$4.6 trillion in 2018, could be in play over the next five years.¹² And COVID-19 has roiled production and consumption patterns, possibly for a long time.

2. Radical changes in the macroenvironment. The COVID-19 pandemic has delivered the biggest and broadest economic shock in recent memory. Another macro shock, at least for the underlying profitability of the banking system, is that it will produce or prolong a zero percent interest-rate environment in several regions. Europe has seen zero rates for a while; now something similar is coming to the United States, where the Federal Reserve is opting to spur economic activity through greater borrowing and access to cheap credit for both corporations and individuals. Only Asia (with the notable exception of Japan) and

some emerging markets seem less affected by this trend.

3. Upheaval in the ways we work. The crisis has upended our traditional ways of working, some of which were already beginning to evolve. Before the pandemic, most banks were barely experimenting with distributed teams, remote work, digital tools, and agile processes. In the months since, these changes in workflow and behavior have taken root, shaping a broad, wholesale change in ways of working. At the time of writing, the majority of bank employees are still working from home. Many banks are setting up new operating models in which a large proportion of their employees will have a permanent option to work from home several days a week. For those still required to perform work in person, work has been transformed to accommodate lower staffing levels and reduced contact with customers.

4. Growing challenges from tech players and embedded finance. Fintechs, small digital banks, and other tech-based competitors have been part of the financial-services ecosystem for several years. Banks have partnered and absorbed many of the most complementary new ideas along

¹² For more information, see "Risk, resilience, and rebalancing in global value chains," McKinsey Global Institute, August 2020, on McKinsey.com.

the way. Now the long-anticipated threat from platform companies is accelerating. Look no further than the widespread use of WeChat Pay and AliPay. In other regions, Apple Pay's growth is accelerating. In commercial lending, fintechs such as Fundbox are embedding lending into major software platforms, while others such as Stripe are creating platforms to simplify access to payments and financial services. As customer trust in platform companies increases, banks are at risk of losing the primary customer relationship—and of becoming providers of commodity products.

5. Transformed customer expectations.

Expectations were on the rise long before COVID-19, but this pandemic has ratcheted them to new levels. Many retail and commercial customers will suffer vastly from the pandemic and will expect their financial-services providers to offer loan support or relief. Customers also are increasingly expecting banks to anticipate not only what products and services they need, but also how and when they need them. In particular, many expect to be able to do everything digitally and remotely.

6. Increasing urgency of social and environmental sustainability.

Expectations of business were in flux before the pandemic, as the world started to grapple with economic inequality and climate change. The pandemic threatens to wrench income and wealth gaps even wider, as most knowledge workers have kept their jobs and millions of others have become victims of a pandemic that has brought entire industries to a standstill. Carbon emissions have decreased in many regions during the outbreak, but that won't last, and climate risks will return with a vengeance. In Ho Chi Minh City, direct infrastructure damage from a 100-year flood could more than double from a range of about \$200 million to \$300 million today to \$500 million to \$1 billion by 2050, while knock-on costs could soar from a range of \$100 million to \$400 million to between \$1.5 billion and \$8.5 billion.¹³ In addition, as the US population recognizes the extent and significance of continued racial injustice, this greater consciousness is also spreading to other countries with similar challenges. The world now demands responsible capitalism, not least from the banking industry, which cannot afford to stay on the sidelines.

For banks, the implications run deep. To thrive in a post-COVID world, they must respond on three levels: their muscle (the way they get things done),

their bones (the way they are structured), and their spirit (their reason for being). In the remainder of this chapter, we explore actions on each of these levels:

- embedding the speed and agility banks have summoned in the crisis
- fundamentally reinventing the business model
- bringing environmental, social, and governance (ESG) considerations to the fore, along with a better sense of corporate purpose

Embed newfound speed and agility

Nine months in, the COVID-19 crisis has changed the way work gets done. Business cycles have shortened from quarters to mere weeks. Banks and other companies have shifted millions of decisions out of stable, long-running processes to group videoconferences for instant resolution. Banks have conjured up new products and new services in a weekend, motivated not only by the instinct for survival, but also by a desire to ensure the right support for customers in a time of dire need.

In this way, the pandemic has given banks a glimpse of the potential for a different way of operating. It's not dissimilar to the first sub-four-minute mile: running so fast seemed impossible until Roger Bannister achieved it in a 1954 race, but that record was matched within weeks. Likewise, banks' achievements to date have been made by adrenaline and force of will—and much more is now possible. Banks need to shift to a more sustainable [speed by design, with customer centricity at its core](#). They can keep the helpful aspects of their new ways of working and embed them in the corporate culture while mitigating the less productive effects of working from home and other new behaviors. Time is of the essence, before people revert to old and still-comfortable behaviors.

To embed the best of the new ways of working and banish the worst, banks can pursue four actions:

- institutionalize the new decision-making patterns
- focus on the customer
- embed the new rules of thumb for data
- reimagine work for agile, remote teams

¹³ For more information, see "Climate risk and response: Physical hazards and socioeconomic impacts," McKinsey Global Institute, January 2020, on [McKinsey.com](#).

Institutionalize the new decision-making patterns

Banks have discovered that they can manage well with fewer deciders and more doers. Top teams have focused on essential decisions and delegated the rest. To keep making choices at the same speed, banks can do a few things. Clarifying single-point accountability for key decisions and showing support for those accountable is paramount. Top teams need to make sure that they are retaining the most important choices and delegating the others to the appropriate person lower down in the organization. Accountable parties should have the authority to make decisions without several committee meetings or escalation and without the need for analysis until paralysis. And they should expect that executives will have their back if others disagree. This requires creating the right leadership-development model, ensuring that the right leaders are given the most critical roles at all layers of the organization, and apprenticing leaders to be accountable for making timely, tough decisions.

moved standing committees to more frequent and shorter interactions, and simplified cross-cutting decision making by reducing process steps and clarifying responsibilities. The team is tracking its effectiveness with a pulse survey, whose results have ticked noticeably higher, with overwhelmingly positive comments from executives.

Focus on the customer

Of the difficult, rapid decisions that banks have made this year, many addressed critical, emerging customer needs. Whether to ramp up safe digital banking capabilities, institute forbearance programs for customers who could not pay, or launch new government-backed small-business loan products, banks suddenly reshaped their priorities to center on their customers. As a result, months into the crisis, over 70 percent of customers in nearly every country reported that their bank was meeting their expectations.¹⁴

Banks can entrench this new customer focus by ensuring that they have the capabilities to generate continuous customer insights and make

Banks can entrench this new customer focus by ensuring that they have continuous customer insights

Meanwhile, the executive team can model these behaviors and focus on the decisions that have potential to reshape the organization. These choices need an executive sponsor to frame the problem, an understanding of their interdependencies, quality debate that moves quickly to solutions, and comfort with imperfect data and “good enough” solutions. To be sure, in this highly regulated industry, more decisions might naturally fall to the top of the house than in other companies. Top teams will need to strike the right balance between decision making and delegation.

The executive team of a midsize European bank took these steps and a few others. They “declared war” on meetings and reports by establishing new norms (no entourage, clearer agendas, short preview memos outlining decision options),

them accessible to business leaders across the enterprise. Leaders should also continue to model customer centricity by asking a consistent series of questions about customers’ feedback and needs in every product-focused meeting. They should spend regular time with customers and should require an understanding of customer benefits for any new initiative proposed. As they emerge out of crisis mode, leading customer-centric banks can take a look back at their performance and do a critical diagnostic of the customer experience they provided, which will likely reveal some important points of failure.

¹⁴ John Euart, Nuno Ferreira, Jonathan Gordon, Ajay Gupta, Atakan Hilal, and Olivia White, “Financial life during the COVID-19 pandemic— an update,” July 2020, McKinsey.com.

Banks may soon face critical decisions such as how to respond to an acquirer's overtures or how to treat a client's bankruptcy.

Embed the new rules of thumb for data

One likely failure point involves data: in the crisis, a lot of banks' data have proved not just imperfect but nearly useless. That's how much consumer and corporate behaviors have changed. Banks need to distill what they've learned about data and apply it broadly.

The need for immediate data and speedy analytics capabilities to apply to them has rarely been so acute. (Scenario planning is a particularly acute need; see sidebar, "Scenario planning for an unruly world.") Rapid decisions have become almost routine in 2020: how to manage through government health mandates, whether to extend credit, whether to participate in government relief programs such as the US government's Paycheck Protection Program and the United Kingdom's Bounce Back Loan Scheme. Banks may soon face critical decisions such as how to respond to an acquirer's overtures or how to treat a client's bankruptcy.

To answer major strategic questions at COVID-19 speed, teams must triage their analyses ruthlessly to focus on those with the most impact and expand their data sources and analytical methods. New low-latency data sources such as mobility data provide immediate visibility into regional differences in economic activity without the lag attendant on traditional surveys such as the Federal Reserve's Beige Book. Analytical approaches can no longer rely on algorithms built on now-fractured trends. Banks need to recode their models to address recent discontinuities such as broad-based income-support programs or sectoral disparities. Successful analytical approaches add overlays of human judgment and triangulate between traditional approaches and new ones such as bottom-up simulations and

Bayesian causal networks (an approach to avoid bias in machine learning).

Agile while remote: Move to the next frontier

Banks did well in 2020's rapid transition to remote work. Most likely, some remote work will continue—or at least, teams will continue to be located in different physical work spaces. That's a problem: many agile principles depend on co-location. Banks that are already working agilely need to reconceive how work gets done (and for banks that haven't adopted agile yet, it's a great time to jump in). First, banks should be thoughtful about forming small teams of five to ten people (a number that can interact productively by videoconference) and ensure that these teams are cross-functional, to minimize the number of meetings and interactions needed to coordinate across function. For example, in central functions, banks can create agile teams of experts—a mix of marketing specialists, product and commercial specialists, user-experience designers, data analysts, and IT engineers—to understand the ways that customers' journeys have changed in the pandemic, create better products for those needs, and deliver those products to market faster.

In addition, as banks focus on making hybrid remote/onsite models work, more standardization would help by providing clear working norms for teams that are quickly forming and re-forming across locations. Some of these norms can include a common meeting cadence with a set typical agenda and format to maximize the effectiveness of live interactions. Another example is a clear, digital single source of truth, such as visual dashboards, for communicating priorities and progress made.

Reinvent the business model

Two factors are pushing banks to question the foundations of their business models. The first, present before the crisis but now more acute, is the expectation of low or negative interest rates for years to come. With such historical dependence on interest income, how will banks make ends meet? They might begin by thinking big about what business they are in now and what business they want to be in. Many might conclude that they want to shift away from business models built on risk intermediation and toward models built on intermediation of services. Investors have recognized the importance of this. Over the past few years, financial-services business models

that rely on fees, such as payment networks, have seen their valuations rise steadily faster than risk-intermediation businesses like traditional banks. For the first time, in 2020, the total market capitalization of the largest three payments companies globally surpassed that of the three largest banks.

A second critical factor is the challenge from fintechs and technology platforms as they encroach on key banking businesses. These challengers do not rely on interest income to succeed in financial services; indeed, many do not rely on financial-services products at all. Smaller fintechs often thrive on origination fees or debit interchange, leaving interest-rate risk to

Scenario planning for an unruly world

COVID-19 has shown that disruptions can happen at any time and even the best-prepared institutions are unable to predict them. Preparation does, however, yield greater resilience. For example, the experience of SARS in 2002 caused many Asian countries to invest differently in their public-health systems. These countries mitigated the public-health consequences of COVID-19 much more effectively than Western countries and restored their economies faster.

Banks can do something similar. The novel coronavirus was not a so-called black-swan event. A viral pandemic is a quantifiable risk event at any time and could even be considered likely within a period of several decades. Many epidemiologists and others had noted the possibility. Similarly, there are gray-swan events (known and unlikely possibilities) that banks should begin anticipating, many of which are linked to the pandemic.¹⁵ One such event could be another lurch downward in sectors that have already been hard-hit, such as air travel. Another might be rising geopolitical tensions leading to a cataclysmic event. Geopolitical risks leading to protectionist

or isolationist policies were building before COVID-19. The pandemic may accelerate the trend, and as global trade and financial flows taper off, global supply chains and payments infrastructure could break down.

Another gray swan might be a significant cyberattack. The pandemic has pushed vastly more business activity online and greatly expanded the potential for a broad-based cyberattack, potentially affecting billions of bank accounts worldwide. Such an event could cause grievous losses and erode public trust in financial institutions.

Perhaps the most likely gray swan is a tech company's successful launch of a scalable bank offering with a cost base dramatically lower than the current industry average. As we mentioned earlier, disintermediation by tech players is an accelerating trend that banks should be prepared to face.

Gray swans intensify the need for constant surveillance. Scenario planning is not a one-off activity. The events of the past decade, culminating in COVID-19,

demonstrate that the future often arrives sooner than expected. Banks need to develop a set of scenarios for the resolution of the pandemic, with more than the usual single scenario in the middle of the distribution. Further, they should not be bashful about tweaking these scenarios as events unfold. No planning team is going to get everything exactly right on paper. Adroit scenarists refine their outlooks continually to reflect reality.

In practice, this means developing scenarios that account for developments along multiple dimensions and then planning steps to take in various cases that combine these outcomes. For example, one dimension might be COVID-19 [vaccine effectiveness and the timeline to herd immunity](#); another might be the level of trade tensions; a third might be the extent of supply-chain disruptions. The benefit of such multidimensional scenarios isn't necessarily the correctness of any one of them; it's the resulting clarity on what would trigger action on each dimension and what that action would be.

¹⁵ Tucker Bailey, Soumya Banerjee, Christopher Feeney, and Heather Hogsett, "Cybersecurity: Emerging challenges and solutions for the boards of financial-services companies," October 2020, McKinsey.com.

their partner banks. Larger platforms monetize customer data and engagement from financial services to fuel their other businesses. As a result, they are focused on offering customers a seamless customer experience along an end-to-end journey, innovative products, and attractive rates that will drive engagement.

These forces are putting three actions on banks' agendas:

- plan to operate in a prolonged low-rate environment
- create new fee-based income streams
- adopt the challenger playbook

Plan to operate in a prolonged low-rate environment

If there was any lingering doubt, the COVID-19 crisis has made clear that zero or negative interest rates are here to stay. In many parts of the world, central banks are likely to maintain low rates for years to come, further damaging banks' primary business of earning net interest income. It is a major issue in Europe; in October, the Bank of England indicated as much by [requesting details](#) on how well banks' current business models will operate under zero or negative rates. It's also a real pressure point in the United States. For much of Asia, where rates remain higher, it's less of a problem, with the notable exception of Japan, where rates have been low or near zero for decades.

To be sure, low rates have one direct positive effect for banks: they increase customers' ability to repay and can reduce nonperforming loans. Another, less direct benefit also has helped banks: lower borrowing costs for governments have made possible some huge public-support programs. In many countries, amid the many competing needs, such programs have been feasible only because of these lower costs.

But in the long run, zero and negative rates can have a devastating impact on bank economics. That impact is not immediate; it starts to bite as new loans originated at lower rates replace loans coming to term and as some of the back book gets progressively repriced. With today's business models, it is certain to bind over time across all components of the balance sheet.

Bank treasurers and asset-liability management (ALM) teams play central roles in shoring up those parts of the balance sheet and the businesses

that depend on net interest margin. Three moves are vital:

- **Identify and understand all relevant risks.** Treasurers and ALMs can make technical corrections such as choosing a sufficiently long horizon to capture the impact of negative rates on net-interest margins and the balance sheet. They might also identify the risks inherent in customer behaviors, such as prepayment risk in loans and attrition risk in deposits.
- **Optimize risk/return of funding and liquidity.** Banks need an effective governance model and a clear risk-appetite framework for funding and liquidity that will allow the treasurer and risk managers to make transparent, informed, and effective proposals, including hedges where necessary. For example, they might look for the effect of customer behavior on nonmaturing deposit balances, as those feed into interest-rate risk models and hedging strategies. They might need to revisit assumptions on the size, composition, and funding tenor of the liquidity buffer. And they should think about how to use liquidity in foreign subsidiaries or branches, which can become trapped on local balance sheets because of legal or regulatory requirements.
- **Rewire the commercial approach.** Treasurers and ALMs need a funds-transfer pricing mechanism and limit system that provides business lines with incentives to generate interest-bearing assets, bring down funding costs, increase the stability of deposits, and minimize liquidity-buffer requirements. One idea in this area would be for treasurers and ALMs to provide incentives to underwrite in currencies with positive interest rates (while maintaining consistent risk collateralization to manage implied risk-weighted assets (RWAs)). They might introduce tiered pricing for larger deposit balances, referenced to central-bank rates as appropriate for the client segment and purpose of deposits. And they might stimulate a shift of unstable deposits with a zero interest-rate floor into alternative investment products, such as deposit platforms, sweeps, fund solutions, cash exchange-traded funds, and insurance-based savings plans.

Our experience and analysis suggest that through a combination of these moves, banks may be able to mitigate a significant part of the forecast depletion of net-interest margins. The degree

50-75%

growth in noninterest income over the last decade, particularly in China

of mitigation will depend on a bank's business model, its risk appetite, its ability to employ more capital, and the degree to which the specific levers discussed in this report have already been deployed. The exact shape of the yield curve will also play a role.

Create new, customer-centric fee-based income streams

With interest income on the wane, banks need new revenue streams to grow and thrive. One of the most compelling options is to develop new fee-based businesses to counter the loss of interest income. Despite some growth in noninterest income over the last decade, particularly in China, interest income still makes up 50 to 75 percent of total income, depending on region (**Exhibit 15**). Existing fee pools aren't sufficient; banks will need to innovate with service-related income and new products that move away from the dependence on interest. Leading banks are turbocharging longstanding efforts to offer or expand services that are paid in fees rather than net interest margin.

To build fee income, banks can take several tacks: develop a fine-grained understanding of their customers, gain deep insights into the needs of a particular segment, or design a suite of end-to-end services that can extend their customer relationship into new products. For retail customers, that might mean a subscription model for services, which could redefine where

the customer's relationship with the bank begins and ends. What was previously a single unsecured lending product could become a holistic offering that includes, yes, a loan but also other services that provide tangible value. Rather than charging interest on the loan, the bank charges a regular fee to secure access to those services, just as apps on a phone do. Although these types of business models are not new, they are regaining interest as fintechs adopt them and as customers grow accustomed to app subscription models. The wealth-management start-up Robinhood offers an example: it does not charge management fees, but customers pay subscription fees to invest on margin. To get started, a bank can focus on an industry vertical or a customer segment where it already has a foothold and develop services that extend the relationship.

Similarly, commercial banks that are seeing interest income streams dry up must look for adjacent products to build and offer—for example, products tailored for an industry vertical that provide clients more value-added services. Rather than thinking about how to serve clients at the lowest rate, banks can aim instead to help them at their economic leverage points to enable their core business. These leverage points are not always financial; some are operational or administrative. Banks need to widen the aperture and consider other services and coordination that would ease them, sometimes even partnering with others to form an ecosystem.

Noninterest income lags interest income in almost every part of the world.

70%

lower costs in steady state for the digital-only bank compared with traditional operations

Banks have designed many such creative arrangements for a range of industries. State Street Corporation's acquisition of Charles River, whose software supports front-, middle-, and back-office work, allowed the bank to offer its investment-firm clients an integrated service that addresses a much broader set of pain points than before. To serve customers in the rubber industry, Singapore's DBS Bank built a digital trading marketplace for suppliers and buyers, then offered additional services, such as financing and insurance, to add more value. And City National Bank, an American bank headquartered in Los Angeles, provides banking and wealth-management services for entertainment professionals while offering entertainment-industry-specific technology solutions such as Exactacts for residuals payments and FilmTrack for rights management.

Adopt the challenger playbook

Adapting to a low-rate world is not the only strategic challenge banks are facing. As the threat of disintermediation by technology platforms becomes more real and as customer expectations for a seamless digital experience rise, banks cannot afford to stand still when it comes to digital and analytics, despite all the progress they have made to date. Leading banks will continue to innovate and leverage the playbooks of their attackers.

In the past decade, some banks have dramatically optimized both revenue and cost for a small part of their business by creating a separate digital-only bank within the bank, essentially building the bank's own disruptor. The digital-only bank can operate at very low cost, up to 70 percent lower in steady state compared with traditional operations. Creating such a separate entity often allows it to be launched faster, with fewer constraints related to legacy technology, and it allows banks to test concepts at lower risk before attempting to transform their entire business. Over time, the bank can move parts of the legacy business to the new system. State Bank of India's YONO is one example; within 24 months, it has acquired more than 26 million customers and created significant value for the bank, achieving breakeven profitability within 18 months. Goldman's Marcus has enjoyed similar success in the United States. These are strategies centered on customer segments that can easily transition to digital-only sales and service. The dramatically lower cost to serve and acquire customers delivers the added advantage that these banks can expand the potential customer base to mass-affluent

customers who are otherwise underserved by incumbents.

Other ideas from the challenger playbook are appealing. As fintechs have done, banks can partner with and embed themselves in the platforms and ecosystems challenging them, thereby gaining the benefits of the platforms' and ecosystems' seamless digital experiences, broad customer base, and access to contextual data. For example, fintechs have reduced acquisition costs for SME and commercial loans by embedding lead generation into software flows. Some fintechs, such as Tradeshift and Fundbox, embed invoice factoring into accounting and enterprise-resource-planning (ERP) software. They allow customers to click a button to finance an invoice based on the creditworthiness of both the payer and payee, to receive the cash earlier than net terms might allow.

Payments-technology companies also have integrated lending products and are exploiting data in ways that banks have yet to pursue. PayPal Working Capital and similar products allow small businesses to borrow short-term cash, based on cash-flow data from their core payments-acceptance products. Both the application and the repayment are embedded in PayPal's account flow. On the consumer side, alternative lenders such as Afterpay, Klarna, and PayPal Credit are increasingly embedding themselves in online-checkout flows to provide credit at the point of sale, in many cases displacing credit cards. On the corporate side, Adyen, a payments company, has developed the ability to serve its customers in a modular fashion to better embed itself. In marketplaces, it can use its data and analytics assets to provide merchants with know-your-business (KYB) services to help them onboard customers to the platform.

Banks do not have to sit on the sidelines: they can also pursue partnerships to embed their own products in these flows. For example, banks could partner with platform companies to provide lending services; underwriting can be made more predictive by the platform company's unique customer data.

Bring ESG and purpose to the fore

Shifts in values take a long time to develop and then seem to leap all at once from the back pages to the headlines. Environmental, social, and governance issues and the larger question of purpose are at that inflection point. Recent years have supplied plenty of impetus, as extreme weather events multiplied, income inequality widened, the #MeToo movement took hold, and demands for racial justice burst into the open. Broad sections of society are embracing lives more focused on ESG impact; people are increasingly

discerning their friends, their employers, and their consumer experiences—including with their banks—on the basis of a shared set of values. In our 2020 survey on ESG, over 75 percent of asset-management CEOs identified sustainable investing as a top-five priority.¹⁶ Reasons include client demand and an unwillingness to fall behind others: globally, sustainable assets under management grew 15 percent per year from 2012 to 2018.

Customers' shifting values are just one of four factors pushing ESG higher on banks' strategic agenda. Another is that better metrics to measure performance are coming online. On environmental issues, for example, new norms from the Sustainability Accounting Standards Board (SASB) and the Task Force on Climate-Related Financial Disclosures (TCFD) are gaining traction. Third, the thousands of disparate voices among NGOs, academics, and other proponents of better ESG management will consolidate, cooperation among them will deepen, and professional management will take root. Pressure from the buy side will join those voices. As the economic impact

others to act.¹⁷ Other banks are champions of best practices; they understand fully the risks and opportunities and are changing their operating model and culture. In a third category, adopters of leading practices, banks are starting on the journey and adopting emerging standards. Finally, industry followers are reacting to expectations from external stakeholders and meeting minimum standards.

No matter what they do, banks will feel the impact of climate change and other ESG issues. The pressure to act is real and should not be discounted. On current trends, banks will be forced to move sooner or later. Furthermore, recent studies have established that a strong ESG proposition correlates with higher equity returns.¹⁸ ESG leaders are doing more than responding to the pressures: they are building solid business cases that support the new behaviors. Following is one way that banks can pull it all together, on behalf of their institutional purpose, their clients, their communities, and their bottom line.

An ESG business in focus: Climate finance

Banks will feel the impact of climate change.

from environmental issues, in particular, becomes increasingly apparent, markets will begin to reflect these expectations. Even if the impact is delayed by a decade, pricing and valuation impacts could be immediate; for example, a property located in a likely future flood zone could start being devalued or costly to insure years before the flooding actually begins. The result will be a much more forceful push for banks to act boldly. The final factor is that many governments have indicated they will expect banks to address perceived ESG problems actively.

Banks are responding, of course, but not all at the same pace. Some are ESG leaders, making these issues a core part of their strategy. Banks in this category are creating standards, embedding ESG standards into internal processes, and influencing

The threats from a changing climate are urgent.¹⁹ Climate finance is the new business of providing capital to companies to either strengthen their resilience to long-term climate hazards or decarbonize their activities. Banks' role in climate finance is crucial—it's the logical outcome of their commitments to the Paris climate accord, and it fulfills a critical part of their contract with society. Building a climate-finance business requires four steps:

1. Think beyond first-level impact. Banks need to consider the whole ecosystem in which they interact, including measuring and accounting for the climate impact of their clients, as their actions can and should help clients on their journey to reduce impact.

¹⁶ McKinsey ESG and Sustainable Investing Survey, November 2020.

¹⁹ For more information, see "Climate risk and response: Physical hazards and socioeconomic impacts," McKinsey Global Institute, January 2020, at McKinsey.com.

2. Shift lending from brown to green. Banks will need to understand the effects of the energy transition in each sector that they serve. This includes emerging technologies that can help incumbent companies decarbonize their activities and competing propositions that could replace legacy approaches, potentially dealing a blow to banks' borrowers. Banks then need to map these technologies to the products they can provide: equity and debt offerings, trading, supply-chain finance, and others. For example, consider "green" hydrogen, which can be used as a fuel cell by truckers and as a feedstock for steelmakers. Banks have many opportunities to serve those involved with this technology. They can get involved at the first stage of the emerging business system by financing the development of new plants through new debt or equity. Banks could collateralize the loans in any number of ways—through a claim against the asset, participation in an off-take agreement, credit insurance, a pledge of other assets, and so on. More opportunities await. Banks could provide working-capital financing and offer bespoke hydrogen futures to help the client hedge. They also could create a trade-finance product for customers of the plant, to help their purchases.

3. Tweak the operating model. Banks need to build some new capabilities to ensure that expertise in this space is scalable and accessible. Increasingly, leading banks have a climate or sustainability center of excellence (COE), with concentrated expertise and resources across risk and ESG. This COE often can partner with external entities and manage external ESG rating agencies. Most banks also need to put in place a control infrastructure to manage climate risk, including gathering new types of data (e.g., carbon intensity) and methods to assess them. This will also require capabilities in developing or analyzing various climate scenarios and their impact on customer behavior and client economics.

4. Measure and correct. Banks should develop an agreed-upon methodology, regularly evaluate the carbon intensity of their portfolio, and track alignment to goals (e.g., Paris commitment).

Banks can be a fast follower in many areas, but ESG is not one of them. It is a societal force that compels banks to get ahead of the curve. For banks that can, it will offer a substantial competitive advantage and a source of new

business or defense of an existing one.

Act from a clear purpose

Beyond climate-transition finance, the ways in which banks can address ESG challenges are many and growing. In the midst of a global pandemic and economic crisis, banks also have a tremendous role to play in the recovery. Contrary to 12 years ago, today's crisis is not the product of the financial system itself. Like many sectors of the economy, banking and its returns and capital positions are and will continue to be negatively affected by this crisis for some time. But unlike many other sectors, banking is also in a position to help bolster the economy, protect lives and livelihoods, and support communities in weathering this crisis.

A bank's purpose should guide many of its most critical choices, including what role it plays in the pandemic recovery, how it approaches ESG issues, and how it finances other sectors of the economy and supports individuals' financial lives. This purpose should reflect the firm's core identity and reason to exist, and it should define a resulting positive impact on society. Doing so is, increasingly, an imperative—especially for banks that are doing well or operate in better-performing markets. Many customers now expect it: more than half prefer to invest in companies that share their values.²⁰ Business leaders agree: 44 percent of Fortune 500 CEOs say their company should actively seek to solve major social problems as part of their core business strategy.²¹

A clear purpose shapes an organization's strategy, inspires its employees, is evident to the broader community, and is fully embedded in the organization's culture. For example, research shows that a clear purpose is associated with employee satisfaction: purpose-driven companies typically see a 40 percent higher retention rate.²² The breadth of this purpose will vary depending on the organization. It can address broad and persistent societal challenges, fulfill a clear mandate to improve access to capital and increase liquidity, or limit itself to more targeted objectives of incentivizing financial health and providing financial education.

Regardless of its scope, a clear purpose can readily identify challenges to address and then help banks to chart and affirm practical actions for meeting the challenges. Such a purpose needs to be embedded in all the dimensions of a bank's

²⁰ "Banking on Shared Value: How Banks Profit by Rethinking Their Purpose," Shared Value Initiative, sharedvalue.org.

A bank's purpose should guide its most critical choices, including what role it plays in the pandemic recovery, how it approaches ESG issues, and how it supports customers.

business. It should be a constant reference when making trade-offs in the strategy. To create accountability and drive progress against this purpose, banks should develop a clear set of performance indicators to measure, and they should tie purpose-led actions to incentives across leadership and executive roles.

Banks that do this well will redefine their business portfolio in line with purpose, including trade-offs and priorities in capital investments. These banks might also review the set of products and services they offer customers, analyze data on the impact these offerings have had on customers and society, and make hard decisions where facts indicate that impact is not in line with their purpose—for example if some products have impaired the financial health of the customers using them.

Banks can also align recruiting, people development, career pathways, and “ways of working” with corporate purpose. For example,

a financial-services company that defines its purpose around the ideas of ensuring financial-services accessibility and financial health made choices in line with this purpose when it came to compensation, benefits, and career-path design for its employees at every echelon of the organization.

Banks, like other sectors of the economy, may face a cold winter ahead, but there is the promise of a thaw. The moment is right for banks to affirm their dual role as sources of stability against the pandemic's upheaval and as beacons to the societies and communities they serve in a post-COVID-19 world. They must act because they have a crucial role to play in the work to restore and sustain livelihoods in their communities.
